Thank you for choosing DELTA’s multifunction VFD-EL Series. The VFD-EL Series is manufactured with high-quality components and materials and incorporate the latest microprocessor technology available.

This manual is to be used for the installation, parameter setting, troubleshooting, and daily maintenance of the AC motor drive. To guarantee safe operation of the equipment, read the following safety guidelines before connecting power to the AC motor drive. Keep this operating manual at hand and distribute to all users for reference.

To ensure the safety of operators and equipment, only qualified personnel familiar with AC motor drive are to do installation, start-up and maintenance. Always read this manual thoroughly before using VFD-EL series AC Motor Drive, especially the WARNING, DANGER and CAUTION notes. Failure to comply may result in personal injury and equipment damage. If you have any questions, please contact your dealer.

**PLEASE READ PRIOR TO INSTALLATION FOR SAFETY.**

---

**DANGER!**

1. AC input power must be disconnected before any wiring to the AC motor drive is made.
2. A charge may still remain in the DC-link capacitors with hazardous voltages, even if the power has been turned off. To prevent personal injury, please ensure that power has turned off before opening the AC motor drive and wait ten minutes for the capacitors to discharge to safe voltage levels.
3. Never reassemble internal components or wiring.
4. The AC motor drive may be destroyed beyond repair if incorrect cables are connected to the input/output terminals. Never connect the AC motor drive output terminals U/T1, V/T2, and W/T3 directly to the AC mains circuit power supply.
5. Ground the VFD-EL using the ground terminal. The grounding method must comply with the laws of the country where the AC motor drive is to be installed. Refer to the Basic Wiring Diagram.
6. VFD-EL series is used only to control variable speed of 3-phase induction motors, NOT for 1-phase motors or other purpose.
7. VFD-EL series shall NOT be used for life support equipment or any life safety situation.

---

**WARNING!**

1. DO NOT use Hi-pot test for internal components. The semi-conductor used in AC motor drive easily damage by high-voltage.
2. There are highly sensitive MOS components on the printed circuit boards. These components are especially sensitive to static electricity. To prevent damage to these components, do not touch these components or the circuit boards with metal objects or your bare hands.
3. Only qualified persons are allowed to install, wire and maintain AC motor drives.

---

**CAUTION!**

1. DO NOT install the AC motor drive in a place subjected to high temperature, direct sunlight, high humidity, excessive vibration, corrosive gases or liquids, or airborne dust or metallic particles.
2. Some parameters settings can cause the motor to run immediately after applying power.
3. Only use AC motor drives within specification. Failure to comply may result in fire, explosion or electric shock.
4. To prevent personal injury, please keep children and unqualified people away from the equipment.
5. When the motor cable between AC motor drive and motor is too long, the layer insulation of the motor may be damaged. Please use a frequency inverter duty motor or add an AC output reactor to prevent damage to the motor. Refer to appendix B Reactor for details.
6. The rated voltage for AC motor drive must be \( \leq 240V \) (\( \leq 480V \) for 460V models) and the mains supply current capacity must be \( \leq 5000A \) RMS.

Chapter 1 Introduction

The AC motor drive should be kept in the shipping carton or crate before installation. In order to retain the warranty coverage, the AC motor drive should be stored properly when it is not to be used for an extended period of time. Storage conditions are:

**CAUTION!**

1. Store in a clean and dry location free from direct sunlight or corrosive fumes.
2. Store within an ambient temperature range of -20 °C to +60 °C.
3. Store within a relative humidity range of 0% to 90% and non-condensing environment.
4. Store within an air pressure range of 86 kPA to 106kPA.
5. DO NOT place on the ground directly. It should be stored properly. Moreover, if the surrounding environment is humid, you should put exsiccator in the package.
6. DO NOT store in an area with rapid changes in temperature. It may cause condensation and frost.
7. If the AC motor drive is stored for more than 3 months, the temperature should not be higher than 30 °C. Storage longer than one year is not recommended, it could result in the degradation of the electrolytic capacitors.
8. When the AC motor drive is not used for longer time after installation on building sites or places with humidity and dust, it’s best to move the AC motor drive to an environment as stated above.

### 1.1 Receiving and Inspection

This VFD-EL AC motor drive has gone through rigorous quality control tests at the factory before shipment. After receiving the AC motor drive, please check for the following:

- Check to make sure that the package includes an AC motor drive, the User Manual/Quick Start and CD.
- Inspect the unit to assure it was not damaged during shipment.
- Make sure that the part number indicated on the nameplate corresponds with the part number of your order.

#### 1.1.1 Nameplate Information

**Example for 1HP/0.75kW 3-phase 230V AC motor drive**

```
MODEL VFD007EL23A
INPUT: 3PH 200-240V 50/60Hz 5.1A
OUTPUT: 3PH 0-240V 4.2A 1.6kVA 0.75kW/1HP
FREQUENCY RANGE: 0.1~600Hz
```

#### 1.1.2 Model Explanation

- **VFD 007 EL 23 A**
  - **Version Type A**: Standard drive
  - **Mains Input Voltage**
    - 11: 115V 1-phase
    - 23: 230V 3-phase
  - **VFD-EL Series**
  - **Applicable motor capacity**
    - 002: 0.25 HP (0.2kW)
    - 004: 0.5 HP (0.4kW)
    - 007: 1 HP (0.75kW)
    - 015: 2 HP (1.5kW)
    - 022: 3 HP (2.2kW)
    - 037: 5 HP (3.7kW)
  - **Series Name (Variable Frequency Drive)**
1.1.3 Series Number Explanation

</tr>
</tbody>
</table>

### RFI Jumper

RFI Jumper: The AC motor drive may emit the electrical noise. The RFI jumper is used to suppress the interference (Radio Frequency Interference) on the power line.

Main power isolated from earth:

If the AC motor drive is supplied from an isolated power (IT power), the RFI jumper must be cut off. Then the RFI capacities (filter capacitors) will be disconnected from ground to prevent circuit damage (according to IEC 61800-3) and reduce earth leakage current.

⚠️ **CAUTION!**

1. After applying power to the AC motor drive, do not cut off the RFI jumper. Therefore, please make sure that main power has been switched off before cutting the RFI jumper.
2. The gap discharge may occur when the transient voltage is higher than 1,000V. Besides, electro-magnetic compatibility of the AC motor drives will be lower after cutting the RFI jumper.
3. Do NOT cut the RFI jumper when main power is connected to earth.
4. The RFI jumper cannot be cut when Hi-pot tests are performed. The mains power and motor must be separated if high voltage test is performed and the leakage currents are too high.
5. To prevent drive damage, the RFI jumper connected to ground shall be cut off if the AC motor drive is installed on an ungrounded power system or a high resistance-grounded (over 30 ohms) power system or a corner grounded TN system.

### 1.1.5 Remove Instructions

#### Remove Front Cover

1. **Step 1**
2. **Step 2**

#### Remove Fan
1.2 Preparation for Installation and Wiring

### 1.2.1 Ambient Conditions

Install the AC motor drive in an environment with the following conditions:

<table>
<thead>
<tr>
<th>Category</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Air</strong></td>
<td>-10 ~ +50°C (14 ~ 122°F) for UL &amp; cUL&lt;br&gt;-10 ~ +40°C (14 ~ 104°F) for side-by-side mounting</td>

Option 1 (-10 to +50°C)

Option 2 (-10 to +40°C)

Air flow

CAUTION!

1. Operating, storing or transporting the AC motor drive outside these conditions may cause damage to the AC motor drive.
2. Failure to observe these precautions may void the warranty!
3. Mount the AC motor drive vertically on a flat vertical surface object by screws. Other directions are not allowed.
4. The AC motor drive will generate heat during operation. Allow sufficient space around the unit for heat dissipation.
5. The heat sink temperature may rise to 90°C when running. The material on which the AC motor drive is mounted must be noncombustible and be able to withstand this high temperature.
6. When AC motor drive is installed in a confined space (e.g. cabinet), the surrounding temperature must be within 10 ~ 40°C with good ventilation. DO NOT install the AC motor drive in a space with bad ventilation.
7. Prevent fiber particles, scraps of paper, saw dust, metal particles, etc. from adhering to the heatsink.
8. When installing multiple AC motor drives in the same cabinet, they should be adjacent in a row with enough space in-between. When installing one AC motor drive below another one, use a metal separation between the AC motor drives to prevent mutual heating.

1.2.2 DC-bus Sharing: Connecting the DC-bus of the AC Motor Drives in Parallel

1. This function is not for 115V models.
2. The AC motor drives can absorb mutual voltage that generated to DC bus when deceleration.
3. Enhance brake function and stabilize the voltage of the DC bus.
4. The brake module can be added to enhance brake function after connecting in parallel.
5. Only the same power system can be connected in parallel.
6. It is recommended to connect 5 AC motor drives in parallel (no limit in horsepower).
power should be applied at the same time
(only the same power system can be connected in parallel)
Power 208/220/230/380/440/480 (depend on models)

For frame A and B, terminal + (-) is connected to the terminal + (-) of the braking module.

**NOTE**
Frame A: VFD002EL11A/21A/23A, VFD004EL11A/21A/23A/43A, VFD007EL21A/23A/43A, VFD015EL23A/43A
Frame B: VFD007EL11A, VFD015EL21A, VFD022EL21A/23A/43A, VFD037EL23A/43A
After removing the front cover, check if the power and control terminals are clear. Be sure to observe the following precautions when wiring.

- **General Wiring Information**
  - **Applicable Codes**
    All VFD-EL series are Underwriters Laboratories, Inc. (UL) and Canadian Underwriters Laboratories (cUL) listed, and therefore comply with the requirements of the National Electrical Code (NEC) and the Canadian Electrical Code (CEC).

  Installation intended to meet the UL and cUL requirements must follow the instructions provided in "Wiring Notes" as a minimum standard. Follow all local codes that exceed UL and cUL requirements. Refer to the technical data label affixed to the AC motor drive and the motor nameplate for electrical data.

  The "Line Fuse Specification" in Appendix B, lists the recommended fuse part number for each VFD-EL Series part number. These fuses (or equivalent) must be used on all installations where compliance with U.L. standards is a required.

- **CAUTION!**
  1. Make sure that power is only applied to the R/L1, S/L2, T/L3 terminals. Failure to comply may result in damage to the equipment. The voltage and current should lie within the range as indicated on the nameplate.
  2. All the units must be grounded directly to a common ground terminal to prevent lightning strike or electric shock.
  3. Please make sure to fasten the screw of the main circuit terminals to prevent sparks which is made by the loose screws due to vibration.
  4. Check following items after finishing the wiring:
     a. Are all connections correct?
     b. No loose wires?
     c. No short-circuits between terminals or to ground?
DANGER!

1. A charge may still remain in the DC bus capacitors with hazardous voltages even if the power has been turned off. To prevent personal injury, please ensure that the power is turned off and wait ten minutes for the capacitors to discharge to safe voltage levels before opening the AC motor drive.

2. Only qualified personnel familiar with AC motor drives is allowed to perform installation, wiring and commissioning.

3. Make sure that the power is off before doing any wiring to prevent electric shock.

2.1 Wiring

Users must connect wires according to the circuit diagrams on the following pages. Do not plug a modem or telephone line to the RS-485 communication port or permanent damage may result. The pins 1 & 2 are the power supply for the optional copy keypad only and should not be used for RS-485 communication.

Figure 3 Wiring for NPN mode and PNP mode

A. NPN mode without external power

B. NPN mode with external power

C. PNP mode without external power

D. PNP mode with external power
1. The wiring of main circuit and control circuit should be separated to prevent erroneous actions.

2. Please use shield wire for the control wiring and not to expose the peeled-off net in front of the terminal.

3. Please use the shield wire or tube for the power wiring and ground the two ends of the shield wire or tube.

4. Damaged insulation of wiring may cause personal injury or damage to circuits/equipment if it comes in contact with high voltage.

5. The AC motor drive, motor and wiring may cause interference. To prevent the equipment damage, please take care of the erroneous actions of the surrounding sensors and the equipment.

6. When the AC drive output terminals U/T1, V/T2, and W/T3 are connected to the motor terminals U/T1, V/T2, and W/T3, respectively. To permanently reverse the direction of motor rotation, switch over any of the two motor leads.

7. With long motor cables, high capacitive switching current peaks can cause over-current, high leakage current or lower current readout accuracy. To prevent this, the motor cable should be less than 20m for 3.7kW models and below. And the cable should be less than 50m for 5.5kW models and above. For longer motor cables use an AC output reactor.

8. The AC motor drive, electric welding machine and the greater horsepower motor should be grounded separately.

9. Use ground leads that comply with local regulations and keep them as short as possible.

10. No brake resistor is built in the VFD-EL series, it can install brake resistor for those occasions that use higher load inertia or frequent start/stop. Refer to Appendix B for details.

11. Multiple VFD-EL units can be installed in one location. All the units should be grounded directly to a common ground terminal, as shown in the figure below. Ensure there are no ground loops.

![Diagram showing wiring options for VFD-EL units]
2.2 External Wiring

<tr>
<th>Items</th>
<th>Explanations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power supply</td>
<td>Please follow the specific power supply requirements shown in Appendix A.</td>
</tr>
<tr>
<td>Fuse/NFB (Optional)</td>
<td>There may be an inrush current during power up. Please check the chart of Appendix B and select the correct fuse with rated current. Use of an NFB is optional.</td>
</tr>
<tr>
<td>Magnetic contactor</td>
<td>Please do not use a Magnetic contactor as the I/O switch of the AC motor drive, as it will reduce the operating life cycle of the AC drive.</td>
</tr>
<tr>
<td>Input AC Line Reactor</td>
<td>Used to improve the input power factor, to reduce harmonics and provide protection from AC line disturbances (surges, switching spikes, short interruptions, etc.). AC line reactor should be installed when the power supply capacity is 500kVA or more or advanced capacity is activated. The wiring distance should be ≤ 10m. Refer to appendix B for details.</td>
</tr>

</tr>
</tbody>
</table>

⚠️ CAUTION!  

Mains power terminals (R/L1, S/L2, T/L3)

- Connect these terminals (R/L1, S/L2, T/L3) via a non-fuse breaker or earth leakage breaker to 3-phase AC power (some models to 1-phase AC power) for circuit protection. It is unnecessary to consider phase-sequence.
- It is recommended to add a magnetic contactor (MC) in the power input wiring to cut off power quickly and reduce malfunction when activating the protection function of AC motor drives. Both ends of the MC should have an R-C surge absorber.
- Please make sure to fasten the screw of the main circuit terminals to prevent sparks which is made by the loose screws due to vibration.
- Please use voltage and current within the regulation shown in Appendix A.
- When using a GFCI (Ground Fault Circuit Interrupter), select a current sensor with sensitivity of 200mA, and not less than 0.1-second detection time to avoid nuisance tripping. For specific GFCI of the AC motor drive, please select a current sensor with sensitivity of 30mA or above.
- Do NOT run/stop AC motor drives by turning the power ON/OFF. Run/stop AC motor drives by RUN/STOP command via control terminals or keypad. If you still need to run/stop AC drives by turning power ON/OFF, it is recommended to do so only ONCE per hour.
- Do NOT connect 3-phase models to a 1-phase power source.

Output terminals for main circuit (U, V, W)

- The factory setting of the operation direction is forward running. The method to control the operation direction is to set by the communication parameters. Please refer to the group 9 for details.
- When it needs to install the filter at the output side of terminals U/T1, V/T2, W/T3 on the AC motor drive. Please use inductance filter. Do not use phase-compensation capacitors or L-C (Inductance-Capacitance) or R-C (Resistance-Capacitance), unless approved by Delta.
- DO NOT connect phase-compensation capacitors or surge absorbers at the output terminals of AC motor drives.
- Use well-insulated motor, suitable for inverter operation.

Terminals [+, -] for connecting brake resistor

- All VFD-EL series don’t have a built-in brake chopper. Please connect an external optional brake unit (BUE-series) and brake resistor. Refer to BUE series user manual for details.
- When not used, please leave the terminals [+, -] open.

### AVI

**Analog voltage Input**

- +10V
- AVI circuit
- AVI
- Internal circuit

- **Impedance:** 47kΩ
- **Resolution:** 10 bits
- **Range:** 0 ~ 10VDC/4~20 mA = 0 ~ Max.
- **Output Frequency:** (Pr.01.00)
- **Selection:** Pr.02.00, Pr.02.09, Pr.10.00
- **Set-up:** Pr.04.14 ~ Pr.04.17

### ACM

**Analog control signal (common)**

- Common for AVI= and AFM

### AFM

**Analog output meter**

- ACM circuit
- AFM
- 0~10V
- Max. 2mA

- **Impedance:** 47Ω
- **Output current:** 2mA max
- **Resolution:** 8 bits
- **Range:** 0 ~ 10VDC
- **Function:** Pr.03.03 to Pr.03.04

**NOTE:** The voltage output type for this analog signal is PWM. It needs to read value by the movable coil meter and is not suitable for A/D signal conversion.

**NOTE:** Control signal wiring size: 18 AWG (0.75 mm²) with shielded wire.
Analog inputs (AVI, ACM)
- Analog input signals are easily affected by external noise. Use shielded wiring and keep it as short as possible (<20m) with proper grounding. If the noise is inductive, connecting the shield to terminal ACM can bring improvement.
- If the analog input signals are affected by noise from the AC motor drive, please connect a capacitor (0.1 μF and above) and ferrite core as indicated in the following diagrams:

wind each wires 3 times or more around the core

Digital inputs (MI1~MI6, DCM)
- When using contacts or switches to control the digital inputs, please use high quality components to avoid contact bounce.

General
- Keep control wiring as far away as possible from the power wiring and in separate conduits to avoid interference. If necessary let them cross only at 90° angle.
- The AC motor drive control wiring should be properly installed and not touch any live power wiring or terminals.

NOTE
- If a filter is required for reducing EMI (Electro Magnetic Interference), install it as close as possible to AC drive. EMI can also be reduced by lowering the Carrier Frequency.

DANGER!
Damaged insulation of wiring may cause personal injury or damage to circuits/equipment if it comes in contact with high voltage.

3.1 Description of the Digital Keypad

There are four LEDs on the keypad:
- **LED STOP**: It will light up when the motor is stop.
- **LED RUN**: It will light up when the motor is running.
- **LED FWD**: It will light up when the motor is forward running.
- **LED REV**: It will light up when the motor is reverse running.

![Control panel diagram](image)
3.5 Trial Run
You can perform a trial run by using digital keypad with the following steps.

1. Setting frequency to F5.0 by pressing ▼.
2. If you want to change direction from forward running to reverse running: 1. press MODE key to find FWD.

2. press UP/DOWN key to REV to finish changing direction.

1. After applying the power, verify that LED display shows F 60.0Hz.
2. Press ▼ key to set frequency to around 5Hz.
3. Press ▼ (RUN) key for forward running. And if you want to change to reverse running, you should press ▼. And if you want to decelerate to stop, please press key.
4. Check following items:
   - Check if the motor direction of rotation is correct.
   - Check if the motor runs steadily without abnormal noise and vibration.
   - Check if acceleration and deceleration are smooth.

If the results of trial run are normal, please start the formal run.

**NOTE**

1. Stop running immediately if any fault occurs and refer to the troubleshooting guide for solving the problem.
2. Do NOT touch output terminals U/T1, V/T2, W/T3 when power is still applied to R/L1, S/L2, T/L3 even when the AC motor drive has stopped. The DC-link capacitors may still be charged to hazardous voltage levels, even if the power has been turned off.
3. To avoid damage to components, do not touch them or the circuit boards with metal objects or your bare hands.
Chapter 4 Parameters

The VFD-EL parameters are divided into 11 groups by property for easy setting. In most applications, the user can finish all parameter settings before start-up without the need for re-adjustment during operation.

The 11 groups are as follows:

Group 0: User Parameters
Group 1: Basic Parameters
Group 2: Operation Method Parameters
Group 3: Output Function Parameters
Group 4: Input Function Parameters
Group 5: Multi-Step Speed Parameters
Group 6: Protection Parameters
Group 7: Motor Parameters
Group 8: Special Parameters
Group 9: Communication Parameters
Group 10: PID Control Parameters

</thead>
<tbody>
<tr>
<td>Settings</td>
<td>Read Only</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>00.01</th>
<th>Rated Current Display of the AC Motor Drive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Settings</td>
<td>Read Only</td>
</tr>
</tbody>
</table>

Pr. 00.00 displays the identity code of the AC motor drive. The capacity, rated current, rated voltage and the max. carrier frequency relate to the identity code. Users can use the following table to check how the rated current, rated voltage and max. carrier frequency of the AC motor drive correspond to the identity code.

Pr.00.01 displays the rated current of the AC motor drive. By reading this parameter the user can check if the AC motor drive is correct.

<table>
<thead>
<tr>

<tr>
<td>0</td>
<td>Parameter can be read/written</td>
</tr>
<tr>
<td>1</td>
<td>All parameters are read-only</td>
</tr>
<tr>
<td>8</td>
<td>Keypad lock</td>
</tr>
<tr>
<td>9</td>
<td>All parameters are reset to factory settings (50Hz, 230V/400V or 220V/380V depends on Pr.00.12)</td>
</tr>
<tr>
<td>10</td>
<td>All parameters are reset to factory settings (60Hz, 115V/220V/440V)</td>
</tr>
</tbody>
</table>

This parameter allows the user to reset all parameters to the factory settings except the fault records (Pr.06.08 ~ Pr.06.12).

50Hz: Pr.01.00 and Pr.01.01 are set to 50Hz and Pr.01.02 will be set by Pr.00.12.

60Hz: Pr.01.00 and Pr.01.01 are set to 60Hz and Pr.01.02 is set to 115V, 230V or 460V.

When Pr.00.02=1, all parameters are read-only. To write all parameters, set Pr.00.02=0.
00.03 Start-up Display Selection

<table>
<thead>
<tr>
<th>Settings</th>
<th>Display</th>
<th>Factory Setting</th>
</tr>

<tr>
<td>3</td>
<td>Display the actual DC BUS voltage in VDC of the AC motor drive</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>Display the output voltage in VAC of terminals U/T1, V/T2, W/T3 to the motor.</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>Display PID analog feedback signal value in %</td>
<td>5</td>
</tr>
<tr>
<td>6</td>
<td>Display the power factor angle in ° of terminals U/T1, V/T2, W/T3 to the motor</td>
<td>6</td>
</tr>
<tr>
<td>7</td>
<td>Display the output power in kW of terminals U, V and W to the motor.</td>
<td>7</td>
</tr>
<tr>
<td>8</td>
<td>Display PID setting and feedback signal.</td>
<td>8</td>
</tr>
<tr>
<td>9</td>
<td>Display the signal of AVI analog input terminal (V).</td>
<td>9</td>
</tr>
<tr>
<td>10</td>
<td>Display the signal of ACI analog input terminal (mA).</td>
<td>10</td>
</tr>
<tr>
<td>11</td>
<td>Display the temperature of IGBT (h) in °C</td>
<td>11</td>
</tr>
</tbody>
</table>

When Pr00.03 is set to 03, the display is according to the setting of Pr00.04.

00.05 User Defined Coefficient K

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.1</th>
<th>Factory Setting: 1.0</th>
</tr>
</thead>
</table>

The coefficient K determines the multiplying factor for the user-defined unit. The display value is calculated as follows:

\[ U \text{ (User-defined unit)} = \text{Actual output frequency} \times K \text{ (Pr.00.05)} \]

Example:
A conveyor belt runs at 13.6m/s at motor speed 60Hz.

\[ K = 13.6/60 = 0.22 \text{ (0.226667 rounded to 1 decimal), therefore Pr.00.05=0.2} \]

With Frequency command 35Hz, display shows U and 35*0.2=7.0m/s.
(To increase accuracy, use K=2.2 or K=22.7 and disregard decimal point.)

00.06 Software Version

<table>
<thead>
<tr>
<th>Settings</th>
<th>Read Only</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>#.#</td>
</tr>
</tbody>
</table>

00.07 Reserved
**00.08 Password Input**

<table>
<thead>
<tr>
<th>Unit: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Settings: 0 to 9999</td>
</tr>
<tr>
<td>Factory Setting: 0</td>
</tr>
</tbody>
</table>

Display: 0~2 (times of wrong password)

- The function of this parameter is to input the password that is set in Pr.00.09. Input the correct password here to enable changing parameters. You are limited to a maximum of 3 attempts. After 3 consecutive failed attempts, a blinking “codE” will show up to force the user to restart the AC motor drive in order to try again to input the correct password.

**00.09 Password Set**

<table>
<thead>
<tr>
<th>Unit: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Settings: 0 to 9999</td>
</tr>
<tr>
<td>Factory Setting: 0</td>
</tr>
</tbody>
</table>

Display:
- 0: No password set or successful input in Pr. 00.08
- 1: Password has been set

- To set a password to protect your parameter settings.
  - If the display shows 0, no password is set or password has been correctly entered in Pr.00.08. All parameters can then be changed, including Pr.00.09.
  - The first time you can set a password directly. After successful setting of password the display will show 1. Be sure to record the password for later use.
  - To cancel the parameter lock, set the parameter to 0 after inputting correct password into Pr. 00.08.
  - The password consists of min. 1 digits and max. 4 digits.

- How to make the password valid again after decoding by Pr.00.08:
  - Method 1: Re-input original password into Pr.00.09 (Or you can enter a new password if you want to use a changed or new one).
  - Method 2: After rebooting, password function will be recovered.

**Password Decode Flow Chart**

- Displays 0 when entering correct password into Pr.00.08.
- Correct Password
- END
- Incorrect Password
- END
- Displays 0 when entering correct password into Pr.00.08.
- 00.09
- 00.08
- 3 chances to enter the correct password.
  - 1st time displays "1" if password is incorrect.
  - 2nd time displays "2", if password is incorrect.
  - 3rd time displays " code" (blinking)
- If the password was entered incorrectly after three tries, the keypad will be locked. Turn the power OFF/ON to re-enter the password.
### Control Mode

<table>
<thead>
<tr>
<th>Display</th>
<th>0</th>
<th>Voltage Frequency Control</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Vector Control</td>
</tr>
</tbody>
</table>

This parameter determines how the motor drive is controlled.

#### V/F: Voltage Frequency Control

1. The mechanical characteristic curve of the motor will not be modified, but the mains frequency and mains voltage will be changed. This control mode allows the motor drive to do open loop running and also allow the motor drive to do closed loop running with a PG card (an optional accessory). Under this control mode, the changes in slip ratio bring the rotary’s modifications in electromagnet torque and in load torques. That is the most obvious characteristic of V/F control.

2. V/F control is a constant value control mode. In this control mode, frequency decreasing and magnetic field increasing are under control. But as the frequency decreases, a problem rises: the insufficiency of motor’s torque in a weaken low frequency magnetic field. To solve this problem, set up Pr07.02 Torque Compensation to compensate torque then to have the best operating performance. The V/F control mode can be applied on water pumps, conveyer belts, compressors and tread mills.

#### Vector Control:

1. The mechanical characteristic curve of the motor will not be modified, but the mains frequency and mains voltage will be changed. This control mode allows the motor drive to do open loop running and also allow the motor drive to do closed loop running with a PG card (an optional accessory). There are changes of coordinates in this control mode. The changes in rotor current and in stator current are only related to the electromagnetic torque. These changes are the characteristics of vector control.

2. The vector control mode can eliminate the relationship between field current vector and armature flux. So that this mode can control independently the field current vector and the armature flux to increase the transient response of the motor drive. The vector control mode can be applied on the following equipments: textile, printing, crane and drilling.

Related parameter: Pr07.02 Torque Compensation.

### 00.11 Reserved

### 00.12 50Hz Base Voltage Selection

<table>
<thead>
<tr>
<th>Settings</th>
<th>0</th>
<th>230V/400V</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>220V/380V</td>
</tr>
</tbody>
</table>

This parameter determines the base voltage for 50Hz.

### 00.13 User defined Value (correspond to max. operating frequency) Unit: 1

| Settings | 0 to 9999 | Factory Setting: 0 |

This parameter corresponds to max. frequency.

#### Notes:

- When Pr.00-13 is not set to 0, “F” will disappear in frequency mode and the right-most digit will blink. Many ranges will be changed to Pr.00.13, including potentiometer, UP/DOWN key, AVI, ACI, multi-step, JOG function and PID function.

- When Pr.00.13 is not set to 0 and the frequency source is from communication, please use Pr.02-18 to change frequency setting because it can’t be set at address 2001H.

### 00.14 Decimal Place of User-defined Value Unit: 1

| Settings | 0 to 3 | Factory Setting: 0 |

It is used to set the position of decimal point of Pr.00.13.

Example: when you want to set 10.0, you need to set Pr.00.13 to 100 and Pr.00.14 to 1.
## Group 1: Basic Parameters

### 01.00 Maximum Output Frequency (Fmax)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.01</th>
<th>Factory Setting: 60.00</th>
</tr>
</thead>
<tbody>
<tr>
<td>50.00 to 600.0 Hz</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This parameter determines the AC motor drive's Maximum Output Frequency. All the AC motor drive frequency command sources (analog inputs 0 to +10V and 4 to 20mA) are scaled to correspond to the output frequency range.

### 01.01 Maximum Voltage Frequency (Fbase)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.01</th>
<th>Factory Setting: 60.00</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.10 to 600.0Hz</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This value should be set according to the rated frequency of the motor as indicated on the motor nameplate. Maximum Voltage Frequency determines the v/f curve ratio. For example, if the drive is rated for 460 VAC output and the Maximum Voltage Frequency is set to 60Hz, the drive will maintain a constant ratio of 7.66 V/Hz (460V/60Hz=7.66V/Hz). This parameter value must be equal to or greater than the Mid-Point Frequency (Pr.01.03).

### 01.02 Maximum Output Voltage (Vmax)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.1</th>
<th>Factory Setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>115V/230V series 0.1 to 255.0V</td>
<td></td>
<td>220.0</td>
</tr>
<tr>
<td>460V series 0.1 to 510.0V</td>
<td></td>
<td>440.0</td>
</tr>
</tbody>
</table>

This parameter determines the Maximum Output Voltage of the AC motor drive. The Maximum Output Voltage setting must be smaller than or equal to the rated voltage of the motor as indicated on the motor nameplate. This parameter value must be equal to or greater than the Mid-Point Voltage (Pr.01.04).

### 01.03 Mid-Point Frequency (Fmid)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.01</th>
<th>Factory Setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.10 to 600.0Hz</td>
<td></td>
<td>1.50</td>
</tr>
</tbody>
</table>

This parameter sets the Mid-Point Frequency of the V/f curve. With this setting, the V/f ratio between Minimum Frequency and Mid-Point frequency can be determined. This parameter must be equal to or greater than Minimum Output Frequency (Pr.01.05) and equal to or less than Maximum Voltage Frequency (Pr.01.01).

### 01.04 Mid-Point Voltage (Vmid)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.1</th>
<th>Factory Setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>115V/230V series 0.1 to 255.0V</td>
<td></td>
<td>10.0</td>
</tr>
<tr>
<td>460V series 0.1 to 510.0V</td>
<td></td>
<td>20.0</td>
</tr>
</tbody>
</table>

This parameter sets the Mid-Point Voltage of any V/f curve. With this setting, the V/f ratio between Minimum Frequency and Mid-Point Frequency can be determined. This parameter must be equal to or greater than Minimum Output Voltage (Pr.01.06) and equal to or less than Maximum Output Voltage (Pr.01.02).

### 01.05 Minimum Output Frequency (Fmin)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.01</th>
<th>Factory Setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.10 to 600.0Hz</td>
<td></td>
<td>1.50</td>
</tr>
</tbody>
</table>

This parameter sets the Minimum Output Frequency of the AC motor drive. This parameter must be equal to or less than Mid-Point Frequency (Pr.01.03).

### 01.06 Minimum Output Voltage (Vmin)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.1</th>
<th>Factory Setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>115V/230V series 0.1 to 255.0V</td>
<td></td>
<td>10.0</td>
</tr>
<tr>
<td>460V series 0.1 to 510.0V</td>
<td></td>
<td>20.0</td>
</tr>
</tbody>
</table>

This parameter sets the Minimum Output Voltage of the AC motor drive. This parameter must be equal to or less than Mid-Point Voltage (Pr.01.04).

The settings of Pr.01.01 to Pr.01.06 have to meet the condition of Pr.01.02 ≥ Pr.01.04 ≥ Pr.01.06 and Pr.01.01 ≥ Pr.01.03 ≥ Pr.01.05.

### 01.07 Output Frequency Upper Limit

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.1</th>
<th>Factory Setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1 to 120.0%</td>
<td></td>
<td>110.0</td>
</tr>
</tbody>
</table>

This parameter must be equal to or greater than the Output Frequency Lower Limit (Pr.01.08). The Maximum Output Frequency (Pr.01.00) is regarded as 100%.

Output Frequency Upper Limit value = (Pr.01.00 * Pr.01.07)/100.
Chapter 4 Parameters

01.08  Output Frequency Lower Limit  
Unit: 0.1  
Settings  0.0 to 100.0%  
Factory Setting: 0.0

- The Upper/Lower Limits are to prevent operation errors and machine damage.  
- If the Output Frequency Upper Limit is 50Hz and the Maximum Output Frequency is 60Hz, the Output Frequency will be limited to 50Hz.  
- If the Output Frequency Lower Limit is 10Hz, and the Minimum Output Frequency (Pr.01.05) is set to 1.0Hz, then any Command Frequency between 1.0-10Hz will generate a 10Hz output from the drive. If the command frequency is less than 1.0Hz, drive will be in ready status without output.  
- This parameter must be equal to or less than the Output Frequency Upper Limit (Pr.01.07).  
- The Output Frequency Lower Limit value = (Pr.01.00 * Pr.01.08) /100.

01.09  Acceleration Time 1 (Taccel 1)  
Unit: 0.1/0.01  
Settings  0.1 to 600.0 sec / 0.01 to 600.0 sec  
Factory Setting: 10.0

- Acceleration/deceleration time 1 or 2 can be switched by setting the external terminals M13~M12 to 7 (set Pr.04.05~Pr.04.08 to 7 or Pr.11.06~Pr.11.11 to 7).

01.10  Deceleration Time 1 (Tdecel 1)  
Unit: 0.1/0.01

01.11  Acceleration Time 2 (Taccel 2)  
Unit: 0.1/0.01

01.12  Deceleration Time 2 (Tdecel 2)  
Unit: 0.1/0.01

- The Acceleration Time is used to determine the time required for the AC motor drive to ramp from 0 Hz to Maximum Output Frequency (Pr.01.00). The rate is linear unless S-Curve is “Enabled”; see Pr.01.17.  
- The Deceleration Time is used to determine the time required for the AC motor drive to decelerate from the Maximum Output Frequency (Pr.01.00) down to 0 Hz. The rate is linear unless S-Curve is “Enabled.”, see Pr.01.18.  
- The Acceleration/Deceleration Time 1, 2, 3, 4 are selected according to the Multi-function Input Terminals Settings. See Pr.04.05 to Pr.04.08 for more details.  
- In the diagram shown below, the Acceleration/Deceleration Time of the AC motor drive is the time between 0 Hz to Maximum Output Frequency (Pr.01.00). Suppose the Maximum Output Frequency is 60 Hz, Minimum Output Frequency (Pr.01.05) is 1.0 Hz, and Acceleration/Deceleration Time is 10 seconds. The actual time for the AC motor drive to accelerate from start-up to 60 Hz and to decelerate from 60Hz to 1.0Hz is in this case 9.83 seconds. ((60-1) * 10/60=9.83secs).
01.13 Jog Acceleration Time  
**Unit:** 0.1/0.01  
**Settings:** 0.1 to 600.0/0.01 to 600.0 sec  
**Factory Setting:** 1.0

01.14 Jog Deceleration Time  
**Unit:** 0.1/0.01  
**Settings:** 0.1 to 600.0/0.01 to 600.0 sec  
**Factory Setting:** 1.0

01.15 Jog Frequency  
**Unit:** 0.01  
**Settings:** 0.10 to Fmax (Pr.01.00)Hz  
**Factory Setting:** 6.00

- Only external terminal JOG (MI3 to MI12) can be used. When the Jog command is “ON”, the AC motor drive will accelerate from Minimum Output Frequency (Pr.01.05) to Jog Frequency (Pr.01.15). When the Jog command is “OFF”, the AC motor drive will decelerate from Jog Frequency to zero. The used Accel/Decel time is set by the Jog Accel/Decel time (Pr.01.13, Pr.01.14).
- Before using the JOG command, the drive must be stopped first. And during Jog operation, other operation commands are not accepted, except FORWARD/REVERSE commands.
01.16 Auto-Acceleration / Deceleration

**Settings**

0  Linear acceleration / deceleration
1  Auto acceleration, linear Deceleration.
2  Linear acceleration, auto Deceleration.
3  Auto acceleration / deceleration (set by load)
4  Auto acceleration / deceleration (set by Accel/Decel Time setting)

- With Auto acceleration / deceleration it is possible to reduce vibration and shocks during starting/stopping the load.
- During Auto acceleration the torque is automatically measured and the drive will accelerate to the set frequency with the fastest acceleration time and the smoothest starting current.
- During Auto deceleration, regenerative energy is measured and the motor is smoothly stopped with the fastest deceleration time.
- But when this parameter is set to 4, the actual accel/decel time will be equal to or more than parameter Pr.01.09 ~ Pr.01.12.
- Auto acceleration/deceleration makes the complicated processes of tuning unnecessary. It makes operation efficient and saves energy by acceleration without stall and deceleration without brake resistor.
- In applications with brake resistor or brake unit, Auto deceleration shall not be used.

01.17 Acceleration S-Curve

**Settings**

0.0  S-curve disabled
0.1 to 10.0/0.01 to 10.00  S-curve enabled (10.0/10.00 is the smoothest)

- This parameter is used to ensure smooth acceleration and deceleration via S-curve.
- The S-curve is disabled when set to 0.0 and enabled when set to 0.1 to 10.0/0.01 to 10.00.
- Setting 0.1/0.01 gives the quickest and setting 10.0/10.00 the longest and smoothest S-curve.
- The AC motor drive will not follow the Accel/Decel Times in Pr.01.09 to Pr.01.12.
- The diagram below shows that the original setting of the Accel/Decel Time is only for reference when the S-curve is enabled. The actual Accel/Decel Time depends on the selected S-curve (0.1 to 10.0).
- The total Accel. Time=Pr.01.09 + Pr.01.17 or Pr.01.11 + Pr.01.17
- The total Decel. Time=Pr.01.10 + Pr.01.18 or Pr.01.12 + Pr.01.18

01.18 Deceleration S-Curve

**Settings**

0.0  S-curve disabled
0.1 to 10.0/0.01 to 10.00  S-curve enabled (10.0/10.00 is the smoothest)

- This parameter is used to ensure smooth acceleration and deceleration via S-curve.
- The S-curve is disabled when set to 0.0 and enabled when set to 0.1 to 10.0/0.01 to 10.00.
- Setting 0.1/0.01 gives the quickest and setting 10.0/10.00 the longest and smoothest S-curve.
- The AC motor drive will not follow the Accel/Decel Times in Pr.01.09 to Pr.01.12.
- The diagram below shows that the original setting of the Accel/Decel Time is only for reference when the S-curve is enabled. The actual Accel/Decel Time depends on the selected S-curve (0.1 to 10.0).
- The total Accel. Time=Pr.01.09 + Pr.01.17 or Pr.01.11 + Pr.01.17
- The total Decel. Time=Pr.01.10 + Pr.01.18 or Pr.01.12 + Pr.01.18

**Diagram:**

- Disable S curve
- Enable S curve

</tr>
</tbody>
</table>

- Set Pr02.02 as [#4: Simple Positioning Stop; E.F.: coast to stop], before setting up Pr01.20 ~ Pr01.35.
- The settings of Pr01.20~Pr01.27 have to correspond to the settings of Pr01.28 ~Pr01.35.

Corresponding parameters:

- (Pr01.20, Pr01.28)
- (Pr01.21, Pr01.29)
- (Pr01.22, Pr01.30)
- (Pr01.23, Pr01.31)
- (Pr01.24, Pr01.32)
- (Pr01.25, Pr01.33)
- (Pr01.26, Pr01.34)
- (Pr01.27, Pr01.35)

- The function of Pr01.28~Pr01.35 is simple positioning. Speed will start to decelerate after the time set at Pr01.28~Pr01.35 elapse. The accuracy of positioning is self-assessed by user.
S = n \times \left( \frac{t_x + (t_x + t_2)}{2} \right)

\begin{align*}
\text{s: distance travelled (round)} \\
\text{n: rotation speed (round/second)} \\
\text{t}_x : \text{ delay time (second)} \\
\text{t}_2 : \text{ deceleration time (second)}
\end{align*}

n = f \times \frac{120}{p}

\begin{align*}
\text{n: rotation speed (round/minute)} \\
\text{p: number of poles of motors} \\
\text{f: rotation frequency (Hz)}
\end{align*}

The value of \( t_x \) in the equation above is as shown below.

When the slope is negative (\( t_1 > t_2 \))

\[
t_x = t_1 + \left( \frac{t_2 - t_1}{t_1 - t_2} \right) (t_1 - t_x) = \left( \frac{t_2 - t_1}{10} \right) (t_2 - t_x)
\]

When the slope is positive (\( t_1 < t_2 \))

\[
t_x = t_2 - \left( \frac{t_2 - t_1}{t_2 - t_1} \right) (t_2 - t_x) = t_2 - \left( \frac{t_2 - t_1}{10} \right) (t_2 - t_x)
\]
As shown in the image below, a 4-pole motor turntable’s diameter $= r$ and its rotation speed $= n$(RPM).

**Example 01**
When that motor turntable is rotating at 50Hz, Pr02.02 =4 [Simple Positioning Stio; E.F.: coast to stop], Pr01.26=50 Hz[Simple Positioning Stop Frequency 6], and its corresponding Pr01.34 =2 sec [Delay Time of Simple Positioning Stop 6], the deceleration time will be 10 sec for decreasing from 50Hz to 0Hz.

When stop command is given, Simple Positioning Stop will be activate, its rotation speed is $n = 120 \times 50/4$ (round/ minute) = 25 (round / second)

Number of rounds of motor turntable = $(25 \times (2 + 12)) / 2 = 175$(rounds)

Therefore the distance travelled by the motor after the stop command is given = number of rounds x circumference = 175x $2\pi r$. That means the turtable went back to the top after 175 rounds.

**Example 02**
Suppose that turntable is rotating at 1.5Hz, the Pr01.22 =10Hz [Simple Positioning Stop Frequency 2], and Pr01.30 =10 sec [Delay Time of Simple Positioning Stop 2], then the deceleration time will be 40 sec for decreasing from 60Hz to 0Hz.

The delay time to stop of 1.5Hz is 1.5sce, the deceleration time is 1 sec for decreasing from 1.5Hz to 0 Hz.

When stop command is given, Simple Positioning Stop will be activate, its rotation speed is $n = 120 \times 1.5/4$ (round/ minute) = 1.5/2 (round / second)

Number of rounds of motor turntable = $(1.5/2 \times (1.5 + 2.5)) / 2 = 1.5$(rounds)

Therefore the distance travelled by the motor after the stop command is given = number of rounds x circumference = 1.5x $2\pi r$. That means the turtable stopped after 1.5 rounds.
Group 2: Operation Method Parameters

02.00 Source of First Master Frequency Command

Factory Setting: 1

02.09 Source of Second Master Frequency Command

Factory Setting: 0

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Digital keypad UP/DOWN keys or Multi-function Inputs UP/DOWN. Last used frequency saved. (Digital keypad is optional)</td>

<td>4 to 20mA from ACI</td>
</tr>
<tr>
<td>3</td>
<td>RS-485 (RJ-45) communication</td>
</tr>
<tr>
<td>4</td>
<td>Digital keypad potentiometer</td>
</tr>
</tbody>
</table>

These parameters set the Master Frequency Command Source of the AC motor drive.

The factory setting for master frequency command is 1. (digital keypad is optional.)

Setting 2: use the ACI/AVI switch on the AC motor drive to select ACI or AVI.

When the AC motor drive is controlled by external terminal, please refer to Pr.02.05 for details.

The first/second frequency/operation command is enabled/disabled by Multi Function Input Terminals. Please refer to Pr.04.05 ~ 04.08.

02.01 Source of First Operation Command

Factory Setting: 1

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Digital keypad (Digital keypad is optional)</td>
</tr>
<tr>
<td>1</td>
<td>External terminals. Keypad STOP/RESET enabled.</td>
</tr>
<tr>
<td>3</td>
<td>RS-485 (RJ-45)/USB communication. Keypad STOP/RESET enabled.</td>
</tr>
</tbody>
</table>

The factory setting for source of first operation command is 1. (digital keypad is optional.)

When the AC motor drive is controlled by external terminal, please refer to Pr.02.05/Pr.04.04 for details.

02.10 Combination of the First and Second Master Frequency Command

Factory Setting: 0

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>

<td>STOP: ramp to stop E.F.: ramp to stop</td>
</tr>
<tr>
<td>3</td>
<td>STOP: coast to stop E.F.: ramp to stop</td>
</tr>
<tr>
<td>4</td>
<td>Simple positioning stop E.F.: coast to stop</td>
</tr>
</tbody>
</table>

The parameter determines how the motor is stopped when the AC motor drive receives a valid stop command or detects External Fault.

Ramp: the AC motor drive decelerates to Minimum Output Frequency (Pr.01.05) according to the deceleration time and then stops.

Coast: the AC motor drive stops the output instantly upon command, and the motor free runs until it comes to a complete standstill.

The motor stop method is usually determined by the characteristics of the motor load and how frequently it is stopped.

(1) It is recommended to use “ramp to stop” for safety of personnel or to prevent material from being wasted in applications where the motor has to stop after the drive is stopped. The deceleration time...
has to be set accordingly.

(2) If motor free running is allowed or the load inertia is large, it is recommended to select “coast to stop”. For example: blowers, punching machines, centrifuges and pumps.

![Graph showing output frequency and motor speed relationship](image)

**02.03 PWM Carrier Frequency Selections**

<table>
<thead>
<tr>
<th>115V/230V/460V Series</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Power</strong></td>
</tr>
<tr>
<td><strong>Setting Range</strong></td>
</tr>
<tr>
<td><strong>Factory Setting</strong></td>
</tr>
</tbody>
</table>

This parameter determines the PWM carrier frequency of the AC motor drive.

<table>
<thead>
<tr>
<th>Carrier Frequency</th>
<th>Acoustic Noise</th>
<th>Electromagnetic Noise or Leakage Current</th>
<th>Heat Dissipation</th>
<th>Current Wave</th>
</tr>
</thead>
<tbody>
<tr>
<td>2kHz</td>
<td>Significant</td>
<td>Minimal</td>
<td>Minimal</td>
<td>Minimal</td>
</tr>
<tr>
<td>8kHz</td>
<td>Minimal</td>
<td>Significant</td>
<td>Significant</td>
<td>Minimal</td>
</tr>
<tr>
<td>12kHz</td>
<td>Minimal</td>
<td>Significant</td>
<td>Significant</td>
<td>Significant</td>
</tr>
</tbody>
</table>

From the table, we see that the PWM carrier frequency has a significant influence on the electromagnetic noise, AC motor drive heat dissipation, and motor acoustic noise.

The PWM carrier frequency will be decreased automatically by the ambient temperature and output current of the AC motor drives. It is used to prevent AC motor drive overheat and extend IGBT’s life. Therefore, it is necessary to have this kind of protection method. Take an example of 460V models, assume that the carrier frequency is 12kHz, ambient temperature is 50 degrees C with single AC motor drive. If the output current exceeds 80% * rated current, the AC motor drive will decrease the carrier frequency automatically by the...
following chart. If output current is around 100% * rated current, the carrier frequency will decrease from 12 kHz to 8 kHz.

### 02.04 Motor Direction Control

**Factory Setting:** 0

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Forward/Reverse operation enabled</td>
</tr>
<tr>
<td>1</td>
<td>Reverse operation disabled</td>
</tr>
<tr>
<td>2</td>
<td>Forward operation disabled</td>
</tr>
</tbody>
</table>

This parameter is used to disable one direction of rotation of the AC motor drive direction of rotation.
**Line Start Lockout**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable. Operation status is not changed even if operation command source Pr.02.01 is changed.</td>
</tr>
<tr>
<td>1</td>
<td>Enable. Operation status is not changed even if operation command source Pr.02.01 is changed.</td>
</tr>
<tr>
<td>2</td>
<td>Disable. Operation status will change if operation command source Pr.02.01 is changed.</td>
</tr>
<tr>
<td>3</td>
<td>Enable. Operation status will change if operation command source Pr.02.01 is changed.</td>
</tr>
</tbody>
</table>

This parameter determines the response of the drive upon power on and operation command source is changed.

<table>
<thead>
<tr>
<th>Pr.02.05</th>
<th>Start lockout (Run when power is ON)</th>
<th>Operation status when operation command source is changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable (AC motor drive will run)</td>
<td>Keep previous status</td>
</tr>
<tr>
<td>1</td>
<td>Enable (AC motor drive doesn’t run)</td>
<td>Keep previous status</td>
</tr>
<tr>
<td>2</td>
<td>Disable (AC motor drive will run)</td>
<td>Change according to the new operation command source</td>
</tr>
<tr>
<td>3</td>
<td>Enable (AC motor drive doesn’t run)</td>
<td>Change according to the new operation command source</td>
</tr>
</tbody>
</table>

When the operation command source is from external terminal and operation command is ON (MI1/MI2-DCM=closed), the AC motor drive will operate according to Pr.02.05 after power is applied. *<For terminals MI1 and MI2 only>*

1. When Pr.02.05 is set to 0 or 2, AC motor drive will run immediately.
2. When Pr.02.05 is set to 1 or 3, AC motor drive will remain stopped until operation command is received after previous operation command is cancelled.

When the operation command source isn’t from the external terminals, independently from whether the AC motor drive runs or stops, the AC motor drive will operate according to Pr.02.05 if the two conditions below are both met.

1. When operation command source is changed to external terminal (Pr.02.01=1 or 2)
2. The status of terminal and AC motor drive is different.

And the operation of the AC motor drive will be:

1. When setting 0 or 1, the status of AC motor drive is not changed by the terminal status.
2. When setting 2 or 3, the status of AC motor drive is changed by the terminal status. It needs to received a run command after previous command is cancelled.

**The Line Start Lockout feature does not guarantee that the motor will never start under this condition. It is possible the motor may be set in motion by a malfunctioning switch.**

<table>
<thead>
<tr>
<th>02.06</th>
<th>Loss of ACI Signal (4-20mA)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Settings</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Decelerate to 0Hz</td>
</tr>
<tr>

</tbody>
</table>

These parameters determine the increase/decrease of the master frequency when operated via the Multi-function Inputs when Pr.04.05~Pr.04.08 are set to 10 (Up command) or 11 (Down command).

When Pr.02.07 is set to 0: increase/decrease the frequency by using UP/DOWN key. It is valid only when the AC motor drive is running.

When Pr.02.07 is set to 1: increase/decrease the frequency by acceleration/deceleration settings. It is valid only when the AC motor drive is running.

When Pr.02.07 is set to 2: increase/decrease the frequency by Pr.02.08.

When Pr.02.07 is set to 3: increase/decrease the frequency by Pr.02.08 (unit: pulse input).

</tr>
<tr>
<td>8</td>
<td>Bit3=1</td>
<td>Operation Command Source by Multi-input function</td>
</tr>
</tbody>
</table>

Factory setting: ##

You can read the operation source by this parameter.
02.18 User-defined Value 2 Setting

Settings 0 to Pr.00.13  
Factory Setting: 0

Use this parameter to change frequency when (1) Pr.00.13 is not set to 0 and frequency source is from communication or (2) Pr.02.10 is not set to 0.

02.19 User-defined Value 2

Settings Read-only  
Factory Setting: 0

For example: suppose that the frequency source is the first master frequency + second master frequency command (first master frequency is from keypad and second master frequency is from AVI), user-defined value 1 is set to 180.0 (Pr.00.13 is set to 1800, Pr.00.14 is set to 1).

AVI=2V=180.0/(2V/10V)=36.0, frequency is 36.0/(180.0/60.0)=12.0Hz
Pr.02.18=30.0, frequency is 30.0/(60.0/180.0)=10.0Hz

At this moment, the keypad will display 66.0(36.0+30.0) and the output frequency is 22.0Hz(12.0+10.0). When reading the value from communication address, the value will be shown as follows: 2102H and 2103H are 22.0Hz, 0212H(Pr.02.18) is 30.0, 0213H(Pr.02.19) is 66.0.

MO 23 description:

If any error occurred on the inverter of the multi-pump system, the RLY will be turned on.

Wiring of the pressure sensor:
Connect pressure sensor to +10V and AVI, then switch the SW2 switch to ACI.

03.01 Reserved

03.02 Desired Frequency Attained

Settings: 0.00 to 600.0 Hz
Factory Setting: 0.00

If a multi-function output terminal is set to function as Desired Frequency Attained (Pr.03.00 = 09), then the output will be activated when the programmed frequency is attained.

Output timing chart of multiple function terminals when setting to frequency attained or zero speed indication.
**4.03**  **Analog Output Signal (AFM)**

<table>
<thead>
<tr>
<th>Settings</th>
<th>0</th>
<th>Analog Frequency Meter (0 to Maximum Output Frequency)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Analog Current Meter (0 to 250% of rated AC motor drive current)</td>
</tr>
</tbody>
</table>

This parameter sets the function of the AFM output 0~+10VDC (ACM is common).

**4.04**  **Analog Output Gain**

| Settings | 1 to 200% | Factory Setting: 100 |

This parameter sets the voltage range of the analog output signal AFM.

- When Pr.03.03 is set to 0, the analog output voltage is directly proportional to the output frequency of the AC motor drive. With Pr.03.04 set to 100%, the Maximum Output Frequency (Pr.01.00) of the AC motor drive corresponds to +10VDC on the AFM output.
- Similarly, if Pr.03.03 is set to 1, the analog output voltage is directly proportional to the output current of the AC drive. With Pr.03.04 set to 100%, then 2.5 times the rated current corresponds to +10VDC on the AFM output.

**NOTE**

Any type of voltmeter can be used. If the meter reads full scale at a voltage less than 10V, Pr. 03.04 should be set using the following formula:

\[
Pr. 03.04 = \left(\frac{\text{meter full scale voltage}}{10}\right) \times 100\%
\]

For Example: When using the meter with full scale of 5 volts, adjust Pr.03.04 to 50%. If Pr.03.03 is set to 0, then 5VDC will correspond to Maximum Output Frequency.

**4.05**  **Terminal Count Value**

| Settings | 0 to 9999 | Factory Setting: 0 |

This parameter sets the count value of the internal counter. To increase the internal counter, one of Pr.04.05 to 04.08 should be set to 12. Upon completion of counting, the specified output terminal will be activated (Pr.03.00 set to 10).

- When the display shows c555, the drive has counted 555 times. If display shows c555, it means that real counter value is between 5,550 and 5,559.

**4.06**  **Preliminary Count Value**

| Settings | 0 to 9999 | Factory Setting: 0 |

When the counter value reaches this value, the corresponding multi-function output terminal will be activated, provided one of Pr.03.00 set to 11 (Preliminary Count Value Setting). This multi-function output terminal will be deactivated upon completion of Terminal Count Value Attained.

**4.07**  **EF Active when Terminal Count Value Attained**

<table>
<thead>
<tr>
<th>Settings</th>
<th>0</th>
<th>Terminal count value attained, no EF display</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Terminal count value attained, EF active</td>
</tr>
</tbody>
</table>

If this parameter is set to 1 and the desired value of counter is attained, the AC drive will treat it as a fault. The drive will stop and show the “EF” message on the display.
**03.08** Fan Control

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Fan always ON</td>
</tr>
<tr>
<td>1</td>
<td>1 minute after AC motor drive stops, fan will be OFF</td>
</tr>
<tr>
<td>2</td>
<td>Fan ON when AC motor drive runs, fan OFF when AC motor drive stops</td>
</tr>
<tr>
<td>3</td>
<td>Fan ON when preliminary heatsink temperature attained</td>
</tr>
<tr>
<td>4</td>
<td>Fan ON when AC motor drive runs, fan OFF when AC motor drive stops and fan will be at standby mode at 0Hz.</td>
</tr>
</tbody>
</table>

This parameter determines the operation mode of the cooling fan.

**03.09** Reserved

**03.10** Reserved

**03.11** Brake Release Frequency

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 600.0Hz</td>
<td>Factory Setting: 0.00</td>

<th>Unit: 0.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 600.0Hz</td>
<td>Factory Setting: 0.00</td>
</tr>
</tbody>
</table>

These two parameters are used to set control of mechanical brake via the output terminals (Relay) when Pr.03.00 is set to 21. Refer to the following example for details.

Example:
1. Case 1: Pr.03.12 ≥ Pr.03.11
2. Case 2: Pr.03.12 ≤ Pr.03.11

<table>
<thead>
<tr>
<th>Frequency Output</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case 1: Pr.03.12</td>
<td></td>
</tr>
<tr>
<td>Pr.03.11</td>
<td></td>
</tr>
<tr>
<td>Case 2: Pr.03.12</td>
<td></td>
</tr>
</tbody>
</table>

**03.13** Display the Status of Relay

<table>
<thead>
<tr>
<th>Settings</th>
<th>Read Only</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factory setting: ##</td>
<td></td>
</tr>
</tbody>
</table>

For standard AC motor drive, the multi-function output terminals are falling-edge triggered.

0: Relay is ON; 1: Relay is OFF.
### Group 4: Input Function Parameters

#### 04.00 Keypad Potentiometer Bias
- **Unit:** 0.1
- **Settings:** 0.0 to 100.0%
- **Factory Setting:** 0.0

#### 04.01 Keypad Potentiometer Bias Polarity
- **Settings:**
  - 0: Positive Bias
  - 1: Negative Bias
- **Factory Setting:** 0

#### 04.02 Keypad Potentiometer Gain
- **Unit:** 0.1
- **Settings:** 0.1 to 200.0%
- **Factory Setting:** 100.0

#### 04.03 Keypad Potentiometer Negative Bias, Reverse Motion Enable/Disable
- **Factory Setting:** 0

---

**Example 1: Standard application**

This is the most used setting. The user only needs to set Pr.02.00 to 04. The frequency command comes from keypad potentiometer.

```
Pr.01.00=60Hz--Max. output Freq.
Potentiometer
Pr.04.00 =0%--Bias adjustment
Pr.04.01 =0--Positive bias
Pr.04.02 =0%--Input gain
Pr.04.03 =0--No negative bias command
```

---

**Example 2: Use of bias**

This example shows the influence of changing the bias. When the input is 0V the output frequency is 10 Hz. At midpoint a potentiometer will give 40 Hz. Once the Maximum Output Frequency is reached, any further increase of the potentiometer or signal will not increase the output frequency. (To use the full potentiometer range, please refer to Example 3.) The value of external input voltage/current 0-8.33V corresponds to the setting frequency 10-60Hz.

```
Gain:100%
Bias adjustment:((10Hz/60Hz)/(Gain/100%))*100%=16.7%
```

---

**Example 3: Use of bias and gain for use of full range**

This example also shows a popular method. The whole scale of the potentiometer can be used as desired. In addition to signals of 0 to 10V, the popular voltage signals also include signals of 0 to 5V, or any value under 10V. Regarding the setting, please refer to the following examples.

```
Gain:(10V/(10V+2V))*100%=83.3%
Bias adjustment:((10Hz/60Hz)/(Gain/100%))*100%=20.0%
```
Example 4: Use of 0-5V potentiometer range via gain adjustment

This example shows a potentiometer range of 0 to 5 Volts. Instead of adjusting gain as example below, you can set Pr. 01.00 to 120Hz to achieve the same results.

Pr.01.00=60Hz--Max. output Freq.
Potentiometer
Pr.04.00 =0.0%--Bias adjustment
Pr.04.01 =0--Positive bias
Pr.04.02 =200%--Input gain
Pr.04.03 =0--No negative bias command

Gain:(10V/5V)*100%=200%

Example 5: Use of negative bias in noisy environment

In this example, a 1V negative bias is used. In noisy environments it is advantageous to use negative bias to provide a noise margin (1V in this example).

Pr.01.00=60Hz--Max. output Freq.
Potentiometer
Pr.04.00 =10.0%--Bias adjustment
Pr.04.01 =1--Negative bias
Pr.04.02 =100%--Input gain
Pr.04.03 =0--No negative bias command

Gain:100%
Bias adjustment:((6Hz/60Hz)/(100%/100%))*100%=10.0%

Example 6: Use of negative bias in noisy environment and gain adjustment to use full potentiometer range

In this example, a negative bias is used to provide a noise margin. Also a potentiometer frequency gain is used to allow the Maximum Output Frequency to be reached.

Pr.01.00=60Hz--Max. output Freq.
Potentiometer
Pr.04.00 =10.0%--Bias adjustment
Pr.04.01 =1--Negative bias
Pr.04.02 =111%--Input gain
Pr.04.03 =0--No negative bias command

Gain:(10V/9V)*100%=111%
Bias adjustment:((6.6Hz/60Hz)/(111%/100%))*100%=10.0%

Example 7: Use of 0-10V potentiometer signal to run motor in FWD and REV direction

In this example, the input is programmed to run a motor in both forward and reverse direction. The motor will be idle when the potentiometer position is at mid-point of its scale. Using the settings in this example disables the external FWD and REV controls.

Pr.01.00=60Hz--Max. output Freq.
Potentiometer
Pr.04.00 =50.0%--Bias adjustment
Pr.04.01 =1--Negative bias
Pr.04.02 =200%--Input gain
Pr.04.03 =1--Negative bias: REV motion enabled

Gain:(10V/5V)*100%=200%
Bias adjustment:((60Hz/60Hz)/(100%/100%))*100%=200%
Example 8: Use negative slope

In this example, the use of negative slope is shown. Negative slopes are used in applications for control of pressure, temperature or flow. The sensor that is connected to the input generates a large signal (10V) at high pressure or flow. With negative slope settings, the AC motor drive will slow stop the motor. With these settings the AC motor drive will always run in only one direction (reverse). This can only be changed by exchanging 2 wires to the motor.

![Diagram showing negative slope]

Pr.01.00 = 60Hz -- Max. output Freq.
Potentiometer
Pr.04.00 = 100% -- Bias adjustment
Pr.04.01 = 0 -- Positive bias
Pr.04.02 = 100% -- Input gain
Pr.04.03 = 1 -- Negative bias: REV motion enabled

Gain: (10V/10V) * 100% = 100%
Bias adjustment: ((60Hz/60Hz)/(Gain/100%)) * 100% = 100%

<table>
<thead>
<tr>

<td>Simple positioning stop by reverse limit</td>
<td>If a motor receives such signal while running backward, it will stop running backward.</td>
</tr>
<tr>
<td>25</td>
<td>Multi-pump control by Hand or Auto mode</td>
<td>When this function is selected, hand or auto mode can be switched from this terminal.</td>
</tr>
</tbody>
</table>

**Hand mode:**
(1) Not using PID<br>(2) Stand-alone system (run command and operating frequency are controlled by the stand-alone system)
**Auto mode:** JOG is disabled.

Wiring of the pressure sensor:
Connect pressure sensor to +10V and AVI, then switch the SW2 switch to ACI

**Hand & Auto mode:**
1. If any error occurred to the pressure sensor, the operation can be switched to be hand mode. That means the operation is controlled by stand-alone system (RUN/STOP)
2. When under auto mode control, only the master pump cab perform operating control.
3. When under auto mode control, the slave pumps can be stopped while the motor drive is performing multipump control. If then a run command is given to the slave pump, it will be controlled by the master pump.

</tbody>
</table>

**Setting 04.09 = 52**

**Note:**

\[
2^9 = 16384, 2^8 = 8192, 2^7 = 4096, 2^6 = 2048, 2^5 = 1024, 2^4 = 512, 2^3 = 256, 2^2 = 128, 2^1 = 64, 2^0 = 32, 2^{-1} = 16, 2^{-2} = 8, 2^{-3} = 4, 2^{-4} = 2, 2^{-5} = 1
\]

**04.10 Digital Terminal Input Debouncing Time**

<table>
<thead>
<tr>
<th><strong>Unit:</strong> 2 msec</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Settings:</strong> 1 to 20</td>
</tr>
<tr>
<td><strong>Factory Setting:</strong> 1</td>
</tr>
</tbody>
</table>

- This parameter is to delay the signals on digital input terminals. 1 unit is 2 msec, 2 units are 4 msec, etc. The delay time is to debounce noisy signals that could cause the digital terminals to malfunction.
Display the Status of Multi-function Input Terminal

<table>
<thead>
<tr>
<th>Settings</th>
<th>Read Only</th>
<th>Factory setting: ##</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Bit0: MI1 Status</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bit1: MI2 Status</td>
<td></td>
</tr>
<tr>

<td>Bit3: MI4 Status</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bit4: MI5 Status</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bit5: MI6 Status</td>
<td></td>
</tr>
</tbody>
</table>

The multi-function input terminals are falling-edge triggered. For standard AC motor drive, there are MI1 to MI6 and Pr.04.26 will display 63 (111111) for no action.

0=Active
1=off

For Example:
If Pr.04.26 displays 52, it means MI1, MI2 and MI4 are active.
The display value 52 = 32+16+4 = 1 X 2^5 + 1 X 2^4 + 1 X 2^2 = bit 6 X 2^5 + bit 5 X 2^4 + bit 3 X 2^2

Internal/External Multi-function Input Terminals Selection

<table>
<thead>
<tr>
<th>Settings</th>
<th>0 to 4095</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
</table>

This parameter is used to select the terminals to be internal terminal or external terminal. You can activate internal terminals by Pr.04.28. A terminal cannot be both internal terminal and external terminal at the same time.

For standard AC motor drive, the multi-function input terminals are MI1 to MI6 as shown in the following.

The Setting method is convert binary number to decimal number for input.

For example: if setting MI3, MI5, MI6 to be internal terminals and MI1, MI2, MI4 to be external terminals. The setting value should be bit5X2^5+bit4X2^4+bit2X2^2 = 1X2^5+1X2^4+1X2^2 = 32+16+4=52 as shown in the following.
This parameter is used to set the internal terminal action via keypad or communication.

For standard AC motor drive, the multi-function input terminals are MI1 to MI6 as shown in the following.

For example, if setting MI3, MI5 and MI6 to be ON, Pr.04.28 should be set to bit5×2^5+bit4×2^4+bit2×2^2= 1×2^5+1×2^4+1×2^2= 32+16+4=52 as shown in the following.

</tr>
</tbody>
</table>
During deceleration, the DC bus voltage may exceed its Maximum Allowable Value due to motor regeneration. When this function is enabled, the AC motor drive will not decelerate further and keep the output frequency constant until the voltage drops below the preset value again.

Over-Voltage Stall Prevention must be disabled (Pr.06.00=0) when a brake unit or brake resistor is used.

**NOTE**

With moderate inertia load, over-voltage stall prevention will not occur and the real deceleration time will be equal to the setting of deceleration time. The AC drive will automatically extend the deceleration time with high inertia loads. If the deceleration time is critical for the application, a brake resistor or brake unit should be used.

---

**Group 6: Protection Parameters**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>115V/230V series</td>
<td>330.0 to 410.0V</td>
</tr>
<tr>
<td>460V series</td>
<td>660.0 to 820.0V</td>
</tr>
<tr>
<td>0</td>
<td>Disable Over-voltage Stall Prevention (with brake unit or brake resistor)</td>
</tr>
</tbody>
</table>
**06.01 Over-Current Stall Prevention during Acceleration**

**Unit:** 1  
**Settings:** 20 to 250%  
**Factory Setting:** 170  
**0:** disable

- A setting of 100% is equal to the Rated Output Current of the drive.  
- During acceleration, the AC drive output current may increase abruptly and exceed the value specified by Pr.06.01 due to rapid acceleration or excessive load on the motor. When this function is enabled, the AC drive will stop accelerating and keep the output frequency constant until the current drops below the maximum value.

**06.02 Over-current Stall Prevention during Operation**

**Unit:** 1  
**Settings:** 20 to 250%  
**Factory Setting:** 170  
**0:** disable

- If the output current exceeds the setting specified in Pr.06.02 when the drive is operating, the drive will decrease its output frequency to prevent the motor stall. If the output current is lower than the setting specified in Pr.06.02, the drive will accelerate again to catch up with the set frequency command value.
06.03 Over-Torque Detection Mode (OL2)

Settings | Factory Setting: 0
---|---
0 | Over-Torque detection disabled.
1 | Over-Torque detection enabled during constant speed operation. After over-torque is detected, keep running until OL1 or OL occurs.
2 | Over-Torque detection enabled during constant speed operation. After over-torque is detected, stop running.
3 | Over-Torque detection enabled during acceleration. After over-torque is detected, keep running until OL1 or OL occurs.
4 | Over-Torque detection enabled during acceleration. After over-torque is detected, stop running.

This parameter determines the operation mode of the drive after the over-torque (OL2) is detected via the following method: if the output current exceeds the over-torque detection level (Pr.06.04) longer than the setting of Pr.06.05 Over-Torque Detection Time, the warning message “OL2” is displayed. If a Multi-functional Output Terminal is set to over-torque detection (Pr.03.00=04), the output is on. Please refer to Pr.03.00 for details.

06.04 Over-Torque Detection Level (OL2)

Settings | Factory Setting: 150
---|---
10 to 200% | 150

This setting is proportional to the Rated Output Current of the drive.

06.05 Over-Torque Detection Time (OL2)

Settings | Factory Setting: 0.1
---|---
0.1 to 60.0 sec | 0.1

This parameter sets the time for how long over-torque must be detected before “OL2” is displayed.

06.06 Electronic Thermal Overload Relay Selection (OL1)

Settings | Factory Setting: 2
---|---
0 | Operate with a Standard Motor (self-cooled by fan)
1 | Operate with a Special Motor (forced external cooling)
2 | Operation disabled

This function is used to protect the motor from overloading or overheating.

06.07 Electronic Thermal Characteristic

Settings | Factory Setting: 60
---|---
30 to 600 sec | 60

The parameter determines the time required for activating the I²t electronic thermal protection function. The graph below shows I²t curves for 150% output power for 1 minute.
In Pr.06.08 to Pr.06.12 the five most recent faults that occurred, are stored. After removing the cause of the fault, use the reset command to reset the drive.
Group 7: Motor Parameters

07.00 Motor Rated Current
Unit: 1

Settings: 30% FLA to 120% FLA
Factory Setting: FLA

Use the following formula to calculate the percentage value entered in this parameter:
(Motor Current / AC Drive Current) x 100%
with Motor Current=Motor rated current in A on type shield
AC Drive Current=Rated current of AC drive in A (see Pr.00.01)

07.01 Motor No-load Current
Unit: 1

Settings: 0% FLA to 90% FLA
Factory Setting: 0.4*FLA

The rated current of the AC drive is regarded as 100%. The setting of the Motor no-load current will affect the
slip compensation.
The setting value must be less than Pr.07.00 (Motor Rated Current).

07.02 Torque Compensation
Unit: 0.1

Settings: 0.0 to 10.0
Factory Setting: 0.0

This parameter may be set so that the AC drive will increase its voltage output to obtain a higher torque.
Too high torque compensation can overheat the motor.

07.03 Slip Compensation Gain
Unit: 0.01

Settings: 0.00 to 10.00
Factory Setting: 0.00

While driving an asynchronous motor, increasing the load on the AC motor drive will cause an increase in slip
decrease in speed. This parameter may be used to compensate the slip by increasing the output
frequency. When the output current of the AC motor drive is bigger than the motor no-load current (Pr.07.01),
the AC drive will adjust its output frequency according to this parameter.

07.04 Motor Parameters Auto Tuning

Settings: 0: Disable
1: Auto-tuning R1 (Motor doesn’t run)
2: Auto-tuning R1 + No-load current (with running motor)
Factory Setting: 0

If setting 1 or 2 are chosen, the auto-tuning on motor will be performed when the motor drive receives the
command. If setting 1 is chosen, only R1 value will be measured. Manually set up Pr.07.01 to measure no-
load current. Before choosing setting 2, discharge manually the motor, then the setting at Pr.07.01 and Pr.07.05 will be used for auto-tuning.

Motor’s auto-tuning, step by step:
1. Make sure all the parameters are at factory setting and the motor is wired correctly.
2. Discharge the motor before setting up parameters. Make sure that motor has only a single shaft, not
attached to any belt or speed reducer.
3. Enter the correct value in the following parameters Pr.01.01 Maximum Voltage Frequency (Fbase),
Pr.01.02 Maximum Output Voltage (Vmax), Pr.07.00 Motor Rated Current, Pr.07.06 Motor Rated Slip
(Motor 0).
4. Set Pr.07.04 = 2 and press RUN command key on the keypad, then the motor’s auto-tuning will begin
(motor is rotating by now).
5. When auto-tuning is done, verify if Pr.07.01 and Pr.07.05 have automatically entered measured data. If
measured data are not entered, set Pr.07.04 = 2 again and press RUN.
6. If Pr.07.01 and Pr.07.05 have automatically entered measured data, setup Pr.00.10 = 1 Vector Control. And
then adjust necessary settings on other parameters.

Related parameters: Pr.01.01 Maximum Voltage Frequency; Pr.01.02 Maximum Output Voltage (Vmax);
Pr.07.00 Motor Rated Current; Pr.07.01 Motor No-Load Current; Pr.07.05 Motor Line-to Line
Resistance R1; Pr.07.06 Motor Rated Slip.

Note
Vector control is not suitable for the following situations: When multiple motors in parallel operation and when
the difference in house power between motor and motor drive is too big.

07.05 Motor Line-to-line Resistance R1 (Motor 0)
Settings: 0~65535mΩ
Factory Setting: 0

This parameter is automatically setup after motor’s auto-tuning but it can also be manually entered
the known parameter of the motor. This is a line-to-line resistance. No matter how the motor is wired,
this resistance is the measured value of any two motor wire-outlets.
### 07.06 Motor Rated Slip (Motor 0)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00~20.00Hz</td>
<td>3.00</td>
</tr>
</tbody>
</table>

- **To setup the rated slip of the motor.**
- **Refer to the rated rpm on the nameplate of the motor and use the following equation to determine the slip.**
  
  \[
  \text{Rated Slip} = F - \frac{N \times P}{120}
  \]
  
  - \(F\): Rated frequency (Hz)
  - \(N\): Rated rotation speed (RPM)
  - \(P\): Number of poles (Pole)
  
  Suppose the rated frequency is 60Hz, number of poles is 4, rated rotation speed is 1650rpm, then the rated slip will be \(60Hz - \left(\frac{1650 \times 4}{120}\right) = 5Hz\).  

- **This parameter is related to Pr07.03 Slip Compensation.** In order to have the best result on slip compensation, make sure that the correct values are filled in the parameters. Any incorrect setting may disable the functions above and even damage the motor and the motor drive.
- **Related parameter:** Pr07.03 Slip Compensation.

### 07.07 Slip Compensation Limit

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0~250%</td>
<td>200</td>
</tr>
</tbody>
</table>

- **This parameter is to provide a correction for the slip compensation by setting up a limit on the slip compensation.** That is to put a percentage on Pr07.06 Motor Rated Slip. If the motor’s speed is less than the target value even after adjusting Pr07.03, the slip compensation gain might have reached its limit. At this time, increase the percentage of the slip compensation limit and then verify the motor’s speed.
- **Related parameters:** Pr07.03 Slip Compensation Gain; Pr07.06 Motor Rated Slip.

### 07.08 Torque compensation Time Constant

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.01~10.00 sec</td>
<td>0.30</td>
</tr>
</tbody>
</table>

- **When a motor’s loading is heavier, its current might suddenly increase and suddenly decreases.** Reason why that happens is because the motor drive is doing current compensation to increase output torque. The sudden increasing/decreasing of current might shake work station. To solve this problem, increase the torque compensation time constant.

### 07.09 Slip compensation Time Constant

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.05~10.00 sec</td>
<td>0.20</td>
</tr>
</tbody>
</table>

- **When a motor’s loading is heavier, its current might suddenly increase and suddenly decreases.** Reason why that happens is because the motor drive is doing speed compensation to reach the same rotating speed. The sudden increasing/decreasing of current might shake work station. To solve this problem, increase the slip compensation time constant.
- **When Pr07.08 and Pr07.09 are set to be 10 seconds, the longest compensation responding time, might cause instability on the system.**

### 07.10 Accumulative Motor Operation Time (Min.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0~1439</td>
<td>0</td>
</tr>
</tbody>
</table>

### 07.11 Accumulative Motor Operation Time (Day)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0~65535</td>
<td>0</td>
</tr>
</tbody>
</table>

- **Pr.07.10 and Pr.07.11 are used to record the motor operation time.** They can be cleared by setting to 0 and time is less than 1 minute is not recorded.

### 07.12 Motor PTC Overheat Protection

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable</td>
</tr>
<tr>
<td>1</td>
<td>Enable</td>
</tr>
</tbody>
</table>

### 07.14 Motor PTC Overheat Protection Level

<table>
<thead>
<tr>
<th>Setting</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1~10.0V</td>
<td>2.4</td>
</tr>
</tbody>
</table>

- **When the motor is running at low frequency for a long time, the cooling function of the motor fan will be lower.** To prevent overheating, it needs to have a Positive Temperature Coefficient thermoistor on the motor and connect its output signal to the drive’s corresponding control terminals.
- **When the source of first/second frequency command is set to AVI (02.00=1/02.09=1), it will disable the function of motor PTC overheat protection (i.e. Pr.07.12 cannot be set to 1).**
If temperature exceeds the setting level, the motor will be coast to stop and \( \frac{V_{+10}}{R_{PTC}} \) is displayed. When the temperature decreases below the level of (Pr.07.15-Pr.07.16) and \( \frac{V_{+10}}{R_{PTC}} \) stops blinking, you can press RESET key to clear the fault.

Pr.07.14 (overheat protection level) must exceed Pr.07.15 (overheat warning level).

The PTC uses the AVI-input and is connected via resistor-divider as shown below.
1. The voltage between +10V to ACM: lies within 10.4V~11.2V.
2. The impedance for AVI is around 47kΩ.
3. Recommended value for resistor-divider R1 is 1~10kΩ.
4. Please contact your motor dealer for the curve of temperature and resistance value for PTC.

Refer to following calculation for protection level and warning level.
1. Protection level
   \[ \text{Pr.07.14} = V_{+10} \times \frac{R_{PTC1}/47K}{R1 + (R_{PTC1}/47K)} \]
2. Warning level
   \[ \text{Pr.07.16} = V_{+10} \times \frac{R_{PTC2}/47K}{R1 + (R_{PTC2}/47K)} \]
3. Definition:
   - \( V_{+10} \): voltage between +10V-ACM. Range 10.4~11.2VDC
   - \( R_{PTC1} \): motor PTC overheat protection level. Corresponding voltage level set in Pr.07.14.
   - \( R_{PTC2} \): motor PTC overheat warning level. Corresponding voltage level set in Pr.07.15.
   - \( R1 \): resistor-divider (recommended value: 1~20kΩ)

Take the standard PTC thermistor as example: if protection level is 1330Ω, the voltage between +10V-ACM is 10.5V and resistor-divider R1 is 4.4kΩ. Refer to following calculation for Pr.07.14 setting.

\[
1330/47000=(1330*47000)/(1330+47000)=1293.4
\]

\[
10.5*1293.4/(4400+1293.4)=2.38(V) \equiv 2.4(V)
\]

Therefore, Pr.07.14 should be set to 2.4.

**Diagram:**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Unit</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pr.07.15</td>
<td>Motor PTC Overheat Warning Level</td>

<td>Warn and keep running</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If temperature exceeds the motor PTC overheat warning level (Pr.07.15), the drive will act according to Pr.07.17 and display \( \frac{V_{+10}}{R_{PTC}} \) if the temperature decreases below the result (Pr.07.15 minus Pr.07.16), the warning display will disappear.
### 07.13 Input Debouncing Time of the PTC Protection

<table>
<thead>
<tr>
<th>Settings</th>
<th>0~9999 (is 0-19998ms)</th>
<th>Factory Setting: 100</th>
</tr>
</thead>
</table>

This parameter is to delay the signals on PTC analog input terminals. 1 unit is 2 msec, 2 units are 4 msec, etc.
**Group 8: Special Parameters**

### 08.00 DC Brake Current Level

<table>
<thead>
<tr>
<th>Setting</th>
<th>Unit: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 to 100%</td>
<td>Factory Setting: 0</td>
</tr>
</tbody>
</table>

- This parameter sets the level of DC Brake Current output to the motor during start-up and stopping. When setting DC Brake Current, the Rated Current (Pr.00.01) is regarded as 100%. It is recommended to start with a low DC Brake Current Level and then increase until proper holding torque has been achieved.

### 08.01 DC Brake Time during Start-up

<table>
<thead>
<tr>
<th>Setting</th>
<th>Unit: 0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0 to 60.0 sec</td>
<td>Factory Setting: 0.0</td>
</tr>
</tbody>
</table>

- This parameter determines the duration of the DC Brake current after a RUN command. When the time has elapsed, the AC motor drive will start accelerating from the Minimum Frequency (Pr.01.05).

### 08.02 DC Brake Time during Stopping

<table>
<thead>
<tr>
<th>Setting</th>
<th>Unit: 0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0 to 60.0 sec</td>
<td>Factory Setting: 0.0</td>
</tr>
</tbody>
</table>

- This parameter determines the duration of the DC Brake current during stopping. If stopping with DC Brake is desired, Pr.02.02 Stop Method must be set to 0 or 2 for Ramp to Stop.

### 08.03 Start-Point for DC Brake

<table>
<thead>
<tr>
<th>Setting</th>
<th>Unit: 0.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 600.0Hz</td>
<td>Factory Setting: 0.00</td>
</tr>
</tbody>
</table>

- This parameter determines the frequency when DC Brake will begin during deceleration.

---

DC Brake during Start-up is used for loads that may move before the AC drive starts, such as fans and pumps. Under such circumstances, DC Brake can be used to hold the load in position before setting it in motion.

DC Brake during stopping is used to shorten the stopping time and also to hold a stopped load in position. For high inertia loads, a brake resistor for dynamic brake may also be needed for fast decelerations.

### 08.04 Momentary Power Loss Operation Selection

<table>
<thead>
<tr>
<th>Setting</th>
<th>Operation details</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Operation stops (coast to stop) after momentary power loss.</td>
</tr>
<tr>
<td>1</td>
<td>Operation continues after momentary power loss, speed search starts with the Master Frequency reference value.</td>
</tr>
<tr>
<td>2</td>
<td>Operation continues after momentary power loss, speed search starts with the minimum frequency.</td>
</tr>
</tbody>
</table>

- This parameter determines the operation mode when the AC motor drive restarts from a momentary power loss.

### 08.05 Maximum Allowable Power Loss Time

<table>
<thead>
<tr>
<th>Setting</th>
<th>Unit: 0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1 to 20.0 sec</td>
<td>Factory Setting: 2.0</td>
</tr>
</tbody>
</table>

- If the duration of a power loss is less than this parameter setting, the AC motor drive will resume operation. If it exceeds the Maximum Allowable Power Loss Time, the AC motor drive output is then turned off (coast stop).

The selected operation after power loss in Pr.08.04 is only executed when the maximum allowable power loss time is ≤20.0 seconds and the AC motor drive displays “Lu”. But if the AC motor drive is powered off due to overload, even if the maximum allowable power loss time is ≤20.0 seconds, the operation mode as set in Pr.08.04 is not executed. In that case it starts up normally.
Chapter 4 Parameters

**08.06 Base Block Speed Search**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable</td>
</tr>
<tr>
<td>1</td>
<td>Speed search starts with last frequency command</td>
</tr>
<tr>
<td>2</td>
<td>Speed search starts with minimum output frequency (Pr.01.05)</td>
</tr>
</tbody>
</table>

This parameter determines the AC motor drive restart method after External Base Block is enabled.

![Diagram](image)

**08.07 Baseblock Time for Speed Search (BB)**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1 to 5.0 sec</td>
<td>Factory Setting: 0.5</td>
</tr>
</tbody>
</table>

When momentary power loss is detected, the AC motor drive will block its output and then wait for a specified period of time (determined by Pr.08.07, called Base-Block Time) before resuming operation. This parameter should be set at a value to ensure that any residual regeneration voltage from the motor on the output has disappeared before the drive is activated again.

This parameter also determines the waiting time before resuming operation after External Baseblock and Auto Restart after Fault (Pr.08.15).
### 08.08 Current Limit for Speed Search

**Unit:** 1  
**Settings:** 30 to 200%  
**Factory Setting:** 150

Following a momentary power loss, the AC motor drive will start its speed search operation only if the output current is greater than the value set by Pr.08.08. When the output current is less than the value of Pr.08.08, the AC motor drive output frequency is at “speed synchronization point”. The drive will start to accelerate or decelerate back to the operating frequency at which it was running prior to the power loss.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Unit</th>
<th>Settings</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>08.09 Skip Frequency 1 Upper Limit</td>
<td>0.01</td>
<td>0.00 to 600.0Hz</td>
<td>0.00</td>
</tr>
<tr>
<td>08.10 Skip Frequency 1 Lower Limit</td>
<td>0.01</td>
<td>0.00 to 600.0Hz</td>
<td>0.00</td>
</tr>
<tr>
<td>08.11 Skip Frequency 2 Upper Limit</td>
<td>0.01</td>
<td>0.00 to 600.0Hz</td>
<td>0.00</td>
</tr>
<tr>
<td>08.12 Skip Frequency 2 Lower Limit</td>
<td>0.01</td>
<td>0.00 to 600.0Hz</td>
<td>0.00</td>
</tr>
<tr>
<td>08.13 Skip Frequency 3 Upper Limit</td>
<td>0.01</td>
<td>0.00 to 600.0Hz</td>
<td>0.00</td>
</tr>
<tr>
<td>08.14 Skip Frequency 3 Lower Limit</td>
<td>0.01</td>
<td>0.00 to 600.0Hz</td>
<td>0.00</td>
</tr>
</tbody>
</table>

These parameters set the Skip Frequencies. It will cause the AC motor drive never to remain within these frequency ranges with continuous frequency output.

These six parameters should be set as follows Pr.08.09 ≥ Pr.08.10 ≥ Pr.08.11 ≥ Pr.08.12 ≥ Pr.08.13 ≥ Pr.08.14.

The frequency ranges may be overlapping.

### 08.15 Auto Restart After Fault

**Unit:** 1  
**Settings:** 0 to 10  
**Factory Setting:** 0

- **Disable**

Only after an over-current OC or over-voltage OV fault occurs, the AC motor drive can be reset/restarted automatically up to 10 times.

- **Disable**

Setting this parameter to 0 will disable automatic reset/restart operation after any fault has occurred.

When enabled, the AC motor drive will restart with speed search, which starts at the frequency before the fault. To set the waiting time before restart after a fault, please set Pr. 08.07 Base Block Time for Speed Search.
### 08.16 Auto Reset Time at Restart after Fault

<table>
<thead>
<tr>
<th>Settings</th>
<th>Unit: 0.1</th>
<th>Factory Setting: 60.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1 to 6000 sec</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Description:** This parameter should be used in conjunction with Pr.08.15. For example: If Pr.08.15 is set to 10 and Pr.08.16 is set to 600s (10 min), and if there is no fault for over 600 seconds from the restart for the previous fault, the auto reset times for restart after fault will be reset to 10.

### 08.17 Automatic Energy-saving

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Energy-saving operation disabled</td>
</tr>
<tr>
<td>1</td>
<td>Energy-saving operation enabled</td>
</tr>
</tbody>
</table>

![Graph showing Energy-saving operation](image)

- **Description:** During auto-energy saving operation, the output voltage is lowered as much as possible to keep the load. The output voltage is maximally lowered to 70% of the normal output voltage.

### 08.18 Automatic Voltage Regulation (AVR)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>AVR function enabled</td>
</tr>
<tr>
<td>1</td>
<td>AVR function disabled</td>
</tr>
<tr>
<td>2</td>
<td>AVR function disabled for deceleration</td>
</tr>
<tr>
<td>3</td>
<td>AVR function disabled for stop</td>
</tr>
</tbody>
</table>

- **Description:** The rated voltage of the motor is usually 230V/200VAC 50Hz/60Hz and the input voltage of the AC motor drive may vary between 180V to 264 VAC 50Hz/60Hz. Therefore, when the AC motor drive is used without AVR function, the output voltage will be the same as the input voltage. When the motor runs at voltages exceeding the rated voltage with 12% - 20%, its lifetime will be shorter and it can be damaged due to higher temperature, failing insulation and unstable torque output.

- **AVR function automatically regulates the AC motor drive output voltage to the Maximum Output Voltage (Pr.01.02).**

- **When the motor ramps to stop, the deceleration time is longer. When setting this parameter to 2 with auto acceleration/deceleration, the deceleration will be quicker.**

### 08.19 Reserved

### 08.20 Compensation Coefficient for Motor Instability

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0~5.0</td>
<td></td>
</tr>
</tbody>
</table>

- **Description:** The drift current will occur in a specific zone of the motor and it will make motor instable. By using this parameter, it will improve this situation greatly.

- **The drift current zone of the high-power motors is usually in the low frequency area.**

- **It is recommended to set to more than 2.0.**
Group 9: Communication Parameters

There is a built-in RS-485 serial interface, marked RJ-45 near to the control terminals. The pins are defined below:

|------------------------|-------------|------|-------|-------|-------|-------------|-------------|-------------|

Each VFD-EL AC motor drive has a pre-assigned communication address specified by Pr.09.00. The RS485 master then controls each AC motor drive according to its communication address.

09.00  Communication Address

 Settings 1 to 254  Factory Setting: 1

- If the AC motor drive is controlled by RS-485 serial communication, the communication address for this drive must be set via this parameter. And the communication address for each AC motor drive must be different and unique.

09.01  Transmission Speed

 Settings 0  Baud rate 4800 bps (bits / second)  1  Baud rate 9600 bps  2  Baud rate 19200 bps  3  Baud rate 38400 bps  Factory Setting: 1

- This parameter is used to set the transmission speed between the RS485 master (PC, etc.) and AC motor drive.

09.02  Transmission Fault Treatment

 Settings 0  Warn and keep operating  1  Warn and RAMP to stop  2  Warn and COAST to stop  3  No warning and keep operating  Factory Setting: 3

- This parameter is set to how to react if transmission errors occur.
- See list of error messages below (see section 3.6.)
09.03 Time-out Detection

Unit: 0.1

<table>
<thead>
<tr>
<th>Settings</th>
<th>0.0 to 120.0 sec</th>
<th>Factory Setting: 0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0</td>
<td>Disable</td>
<td></td>
</tr>
</tbody>
</table>

- If Pr.09.03 is not equal to 0.0, Pr.09.02=0~2, and there is no communication on the bus during the Time Out detection period (set by Pr.09.03), “cE10” will be shown on the keypad.

09.04 Communication Protocol

Factory Setting: 0

<table>
<thead>
<tr>
<th>Settings</th>
<th>0</th>
<th>Modbus ASCII mode, protocol &lt;7,N,2&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Modbus ASCII mode, protocol &lt;7,E,1&gt;</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Modbus ASCII mode, protocol &lt;7,O,1&gt;</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Modbus RTU mode, protocol &lt;8,N,2&gt;</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Modbus RTU mode, protocol &lt;8,E,1&gt;</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Modbus RTU mode, protocol &lt;8,O,1&gt;</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Modbus RTU mode, protocol &lt;8,N,1&gt;</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Modbus RTU mode, protocol &lt;8,E,2&gt;</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Modbus RTU mode, protocol &lt;8,O,2&gt;</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>Modbus ASCII mode, protocol &lt;7,N,1&gt;</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>Modbus ASCII mode, protocol &lt;7,E,2&gt;</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>Modbus ASCII mode, protocol &lt;7,O,2&gt;</td>
<td></td>
</tr>
</tbody>
</table>

- Control by PC
  - A VFD-EL can be set up to communicate in Modbus networks using one of the following modes: ASCII (American Standard Code for Information Interchange) or RTU (Remote Terminal Unit). Users can select the desired mode along with the serial port communication protocol in Pr.09.04.
  - Code Description:
    - The CPU will be about 1 second delay when using communication reset. Therefore, there is at least 1 second delay time in master station.

**ASCII mode:**

Each 8-bit data is the combination of two ASCII characters. For example, a 1-byte data: 64 Hex, shown as ‘64’ in ASCII, consists of ‘6’ (36Hex) and ‘4’ (34Hex).

<table>
<thead>
<tr>
<th>Character</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII code</td>
<td>30H</td>
<td>31H</td>
<td>32H</td>
<td>33H</td>
<td>34H</td>
<td>35H</td>
<td>36H</td>
<td>37H</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Character</th>
<th>8</th>
<th>9</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII code</td>
<td>38H</td>
<td>39H</td>
<td>41H</td>
<td>42H</td>
<td>43H</td>
<td>44H</td>
<td>45H</td>
<td>46H</td>
</tr>
</tbody>
</table>

**RTU mode:**

Each 8-bit data is the combination of two 4-bit hexadecimal characters. For example, 64 Hex.
2. Data Format

For ASCII:

For RTU:
3. Communication Protocol

3.1 Communication Data Frame:

**ASCII mode:**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>STX</td>
<td>Start character ‘.’ (3AH)</td>
</tr>
<tr>
<td>Address Hi</td>
<td>Communication address: 8-bit address consists of 2 ASCII codes</td>
</tr>
<tr>
<td>Address Lo</td>
<td></td>
</tr>
<tr>
<td>Function Hi</td>
<td>Command code: 8-bit command consists of 2 ASCII codes</td>
</tr>
<tr>
<td>Function Lo</td>
<td></td>
</tr>
<tr>
<td>DATA (n-1) to DATA 0</td>
<td>Contents of data: Nx8-bit data consist of 2n ASCII codes n&lt;=20, maximum of 40 ASCII codes</td>
</tr>
<tr>

</tr>
<tr>
<td>CRC CHK High</td>
<td></td>
</tr>
<tr>
<td>END</td>
<td>A silent interval of more than 10 ms</td>
</tr>
</tbody>
</table>

3.2 Address (Communication Address)

Valid communication addresses are in the range of 0 to 254. A communication address equal to 0, means broadcast to all AC drives (AMD). In this case, the AMD will not reply any message to the master device.

00H: broadcast to all AC drives
01H: AC drive of address 01
0FH: AC drive of address 15
10H: AC drive of address 16

FEH: AC drive of address 254

For example, communication to AMD with address 16 decimal (10H):

- ASCII mode: Address='1','0' => ‘1’=31H, ‘0’=30H
- RTU mode: Address=10H

3.3 Function (Function code) and DATA (data characters)

The format of data characters depends on the function code.

03H: read data from register
06H: write single register
08H: loop detection

The available function codes and examples for VFD-EL are described as follows:

(1) 03H: multi read, read data from registers.
Example: reading continuous 2 data from register address 2102H, AMD address is 01H.

</table>
3.4 Check sum

**ASCII mode:**
LRC (Longitudinal Redundancy Check) is calculated by summing up, module 256, the values of the bytes from ADR1 to last data character then calculating the hexadecimal representation of the 2’s-complement negation of the sum.

For example, reading 1 word from address 0401H of the AC drive with address 01H.

<table>
<thead>
<tr>
<th>STX</th>
<th>:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address 1</td>
<td>‘0’</td>
</tr>
<tr>
<td>Address 0</td>
<td>‘1’</td>
</tr>
<tr>
<td>Function 1</td>
<td>‘0’</td>
</tr>
<tr>
<td>Function 0</td>
<td>‘3’</td>
</tr>
</tbody>
</table>
| Starting data address | ‘0’
|                | ‘4’
|                | ‘0’
|                | ‘1’
| Number of data | ‘0’
|                | ‘0’
|                | ‘0’
|                | ‘1’
| LRC Check 1 | ‘F’
| LRC Check 0 | ‘6’
| END 1        | CR |
| END 0        | LF |

01H+03H+04H+01H+00H+01H=0AH, the 2’s-complement negation of 0AH is F6H.
### RTU mode:

<p>| | |</p>

<td>F7H</td>
</tr>
</tbody>
</table>

**CRC (Cyclical Redundancy Check) is calculated by the following steps:**

**Step 1:** Load a 16-bit register (called CRC register) with FFFFH.

**Step 2:** Exclusive OR the first 8-bit byte of the command message with the low order byte of the 16-bit CRC register, putting the result in the CRC register.

**Step 3:** Examine the LSB of CRC register.

**Step 4:** If the LSB of CRC register is 0, shift the CRC register one bit to the right with MSB zero filling, then repeat step 3. If the LSB of CRC register is 1, shift the CRC register one bit to the right with MSB zero filling, Exclusive OR the CRC register with the polynomial value A001H, then repeat step 3.

**Step 5:** Repeat step 3 and 4 until eight shifts have been performed. When this is done, a complete 8-bit byte will have been processed.

**Step 6:** Repeat step 2 to 5 for the next 8-bit byte of the command message. Continue doing this until all bytes have been processed. The final contents of the CRC register are the CRC value. When transmitting the CRC value in the message, the upper and lower bytes of the CRC value must be swapped, i.e. the lower order byte will be transmitted first.

The following is an example of CRC generation using C language. The function takes two arguments:

*Unsigned char* data ← a pointer to the message buffer

*Unsigned char* length ← the quantity of bytes in the message buffer

The function returns the CRC value as a type of unsigned integer.

```c
Unsigned int crc_chk(unsigned char* data, unsigned char length){
    int j;
    unsigned int reg_crc=0xFFFF;
    while(length--){
        reg_crc ^= *data++;
        for(j=0;j<8;j++){
            if(reg_crc & 0x01){  /* LSB(b0)=1 */
                reg_crc=(reg_crc>>1) ^ 0xA001;
            }else{
                reg_crc=reg_crc >>1;
            }
        }
    }
    return reg_crc;
}
```

Note: 2116H is number display of Pr.00.04. High byte of 2117H is number of decimal places of 2116H. Low byte of 2117H is ASCII code of alphabet display of Pr.00.04.

3.6 Exception response:
The AC motor drive is expected to return a normal response after receiving command messages from the master device. The following depicts the conditions when no normal response is replied to the master device.
The AC motor drive does not receive the messages due to a communication error; thus, the AC motor drive has no response. The master device will eventually process a timeout condition.
The AC motor drive receives the messages without a communication error, but cannot handle them. An exception response will be returned to the master device and an error message “CExx” will be displayed on the keypad of AC motor drive. The xx of “CExx” is a decimal code equal to the exception code that is described below.
In the exception response, the most significant bit of the original command code is set to 1, and an exception code which explains the condition that caused the exception is returned.

Example of an exception response of command code 06H and exception code 02H:

<table>
<thead>
<tr>
<th>ASCII mode:</th>
<th>RTU mode:</th>
</tr>
</thead>
<tbody>
<tr>
<td>STX</td>

<tr>
<td>10</td>
<td>Communication time-out: If Pr.09.03 is not equal to 0.0, Pr.09.02=0~2, and there is no communication on the bus during the Time Out detection period (set by Pr.09.03), “cE10” will be shown on the keypad.</td>
</tr>
</tbody>
</table>

3.7 Communication program of PC:
The following is a simple example of how to write a communication program for Modbus ASCII mode on a PC in C language.

```c
#include<stdio.h>
#include<dos.h>
#include<conio.h>
#include<process.h>
```
#define PORT 0x03F8 /* the address of COM1 */
/* the address offset value relative to COM1 */
#define THR  0x0000
#define RDR  0x0000
#define BRDL 0x0000
#define IER  0x0001
#define BRDH 0x0001
#define LCR  0x0003
#define MCR  0x0004
#define LSR  0x0005
#define MSR  0x0006

unsigned char rdat[60];
/* read 2 data from address 2102H of AC drive with address 1 */
unsigned char tdat[60]={'1','0','1','0','3','2','1','0','2', '0','0','0','2','D','7','','
'};
void main(){
    int i;
    outportb(PORT+MCR,0x08); /* interrupt enable */
    outportb(PORT+IER,0x01); /* interrupt as data in */
    outportb(PORT+LCR,(inportb(PORT+LCR) | 0x80)); /* the BRDL/BRDH can be access as LCR.b7==1 */
    outportb(PORT+BRDL,12); /* set baudrate=9600, 12=115200/9600 */
    outportb(PORT+BRDH,0x00);
    outportb(PORT+LCR,0x06); /* set protocol, <7,N,2>=06H, <7,E,1>=1AH, <7,O,1>=0AH, <8,N,2>=07H, <8,E,1>=1BH, <8,O,1>=0BH */
    for(i=0;i<=16;i++){
        while(!(inportb(PORT+LSR) & 0x20)); /* wait until THR empty */
        outportb(PORT+THR,tdat[i]); /* send data to THR */
    }
    i=0;
    while(!kbhit()){ /* b0==1, read data ready */
        if((inportb(PORT+LSR) & 0x01){
            rdat[i++]=inportb(PORT+RDR); /* read data form RDR */
        }
    }
}

09.05 Reserved
09.06 Reserved

09.07 Response Delay Time
Unit: 2ms
Settings 0 ~ 200 (400msec) Factory Setting: 1
This parameter is the response delay time after AC drive receives communication command as shown in the following. 1 unit = 2 msec.

RS485 BUS

| PC command | Handling time of AC drive Max.: 6msec | Response Delay Time Pr.09.07 | Response Message of AC Drive |

09.08 KPC-CC01 Keypad Enable / Disable
Settings 0: Disable Factory Setting: 0
1: Enable

- When Pr09-08-1, the communication formats are 19200, RTU, 8, N, 2
- When using PU06, Pr09.01, Pr09.04 and Pr09.08 are disabled.
- When Pr09.08=1, the communication formats are 19200, RTU, 8, N,.2. Pr09.01. Pr09.04 are also disabled
**Group 10: PID Control**

### 10.00 PID Set Point Selection

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable</td>
</tr>
<tr>
<td>1</td>
<td>Digital keypad UP/DOWN keys</td>
</tr>
<tr>
<td>2</td>
<td>AVI 0 ~ +10VDC</td>
</tr>
<tr>
<td>3</td>
<td>ACI 4 ~ 20mA</td>
</tr>
<tr>
<td>4</td>
<td>PID set point (Pr.10.11)</td>
</tr>
</tbody>
</table>

Factory Setting: 0

**Note:** The measured variable (feedback) controls the output frequency (Hz). Select input terminal accordingly. Make sure this parameter setting does not conflict with the setting for Pr.10.00 (Master Frequency).

When Pr.10.00 is set to 2 or 3, the set point (Master Frequency) for PID control is obtained from the AVI or ACI external terminal (0 to +10V or 4-20mA) or from multi-step speed. When Pr.10.00 is set to 1, the set point is obtained from the keypad.

### 10.01 Input Terminal for PID Feedback

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Positive PID feedback from external terminal AVI (0 ~ +10VDC)</td>
</tr>
<tr>

</tr>
<tr>
<td>2</td>
<td>Positive PID feedback from external terminal ACI (4 ~ 20mA)</td>
</tr>
<tr>
<td>3</td>
<td>Negative PID feedback from external terminal ACI (4 ~ 20mA)</td>
</tr>
</tbody>
</table>

Factory Setting: 0

**Note:** Make sure this parameter setting does not conflict with the setting for Pr.10.00 (Master Frequency).

### 10.11 Source of PID Set point

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
<th>Unit: 0.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 600.00 Hz</td>
<td>Positive PID feedback from external terminal AVI (0 ~ +10VDC)</td>
<td></td>
</tr>
<tr>
<td>0.00 Disable</td>
<td>Negative PID feedback from external terminal AVI (0 ~ +10VDC)</td>
<td></td>
</tr>
<tr>
<td>2.00 Positive</td>
<td>PID feedback from external terminal ACI (4 ~ 20mA)</td>
<td></td>
</tr>
<tr>
<td>3.00 Negative</td>
<td>PID feedback from external terminal ACI (4 ~ 20mA)</td>
<td></td>
</tr>
</tbody>
</table>

Factory Setting: 0.00

**Note:** Make sure this parameter setting does not conflict with the setting for Pr.10.00 (Master Frequency).

### 10.02 Proportional Gain (P)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
<th>Unit: 0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 1.00</td>
<td>Proportional Gain (P)</td>
<td>Unit: 0.1</td>
</tr>
<tr>
<td>0.00 Disable</td>
<td>Proportional Gain (P)</td>
<td>Unit: 0.1</td>
</tr>
</tbody>
</table>

Factory Setting: 0.00

**Note:** Make sure this parameter setting does not conflict with the setting for Pr.10.00 (Master Frequency).

### 10.03 Integral Time (I)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 100.0</td>
<td>Integral Time (I)</td>
</tr>
<tr>
<td>0.00 Disable</td>
<td>Integral Time (I)</td>
</tr>
</tbody>
</table>

Factory Setting: 1.00

**Note:** Make sure this parameter setting does not conflict with the setting for Pr.10.00 (Master Frequency).

### 10.04 Derivative Control (D)

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 to 1.00</td>
<td>Derivative Control (D)</td>
</tr>
</tbody>
</table>

Factory Setting: 0.00

**Note:** Make sure this parameter setting does not conflict with the setting for Pr.10.00 (Master Frequency).
This parameter specifies derivative control (rate of change of the input) and associated gain (D). With this parameter set to 1, the PID output is equal to differential time x (present deviation – previous deviation). It increases the response speed but it may cause over-compensation.

**NOTE**
The parameter can be set during operation for easy tuning.

**10.05 Upper Bound for Integral Control**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 100</th>
</tr>
</thead>
</table>

This parameter defines an upper bound or limit for the integral gain (I) and therefore limits the Master Frequency.

The formula is: Integral upper bound = Maximum Output Frequency (Pr.01.00) x (Pr.10.05). This parameter can limit the Maximum Output Frequency.

**10.06 Primary Delay Filter Time**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 0.0</th>
</tr>
</thead>
</table>

To avoid amplification of measurement noise in the controller output, a derivative digital filter is inserted. This filter helps to dampen oscillations.

The complete PID diagram is in the following:

10.07 PID Output Frequency Limit

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 100</th>
</tr>
</thead>
</table>

This parameter defines the percentage of output frequency limit during the PID control. The formula is Output Frequency Limit = Maximum Output Frequency (Pr.01.00) X Pr.10.07 %. This parameter will limit the Maximum Output Frequency. An overall limit for the output frequency can be set in Pr.01.07.

**10.08 PID Feedback Signal Detection Time**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 60.0</th>
</tr>
</thead>
</table>

This function in only for ACI signal.

This parameter defines the time during which the PID feedback must be abnormal before a warning (see Pr.10.09) is given. It also can be modified according to the system feedback signal time.

If this parameter is set to 0.0, the system would not detect any abnormality signal.

**10.09 Treatment of the Erroneous Feedback Signals (for PID feedback error)**

| Settings       | Factory Setting: 0 |

This function in only for ACI signal.

AC motor drive action when the feedback signals (analog PID feedback) are abnormal according to Pr.10.16.

**10.10 Gain Over the PID Detection Value**

<table>
<thead>
<tr>
<th>Settings</th>
<th>Factory Setting: 1.0</th>
</tr>
</thead>
</table>

This is the gain adjustment over the feedback detection value. Refer to PID control block diagram in Pr.10.06 for detail.
### 10.12 PID Feedback Level

**Unit:** 0.1

**Settings:** 0.0 to 100.0%

**Factory Setting:** 10.0

- When Pr10.12=0, PID feedback error detection is disable.

### 10.13 Detection Time of PID Feedback

**Unit:** 0.1

**Settings:** 0.1 to 300.0 sec

**Factory Setting:** 5.0

- This parameter is used to set detection of the offset between set point and feedback.
- When the offset is higher than (the setting of Pr.10.12 X Pr.01.00) for a time exceeding the setting of Pr.10.13, the AC motor drive will output a signal when Pr.03.00 is set to 16 and will act according to Pr.10.20.

### 10.14 Sleep/Wake Up Detection Time

**Unit:** 0.1

**Settings:** 0.0 to 6550 sec

**Factory Setting:** 0.0

### 10.15 Sleep Frequency

**Unit:** 0.01

**Settings:** 0.00 to 600.0 Hz

**Factory Setting:** 0.00

### 10.16 Wakeup Frequency

**Unit:** 0.01

**Settings:** 0.00 to 600.0 Hz

**Factory Setting:** 0.00

- When the actual output frequency \( \leq \) Pr.10.15 and the time exceeds the setting of Pr.10.14, the AC motor drive will be in sleep mode.
- When the actual frequency command > Pr.10.16 and the time exceeds the setting of Pr.10.14, the AC motor drive will restart.
- When the AC motor drive is in sleep mode, frequency command is still calculated by PID. When frequency reaches wake up frequency, AC motor drive will accelerate from Pr.01.05 minimum frequency following the V/f curve.
- The wake up frequency must be higher than sleep frequency.

![Graph](image)

- When output frequency \( \leq \) sleep frequency and time > detection time, it will go in sleep mode.
- When min. output frequency \( \leq \) PID frequency \( \leq \) lower bound of frequency and sleep function is enabled (output frequency \( \leq \) sleep frequency and time > detection time), frequency will be 0 (in sleep mode). If sleep function is disabled, frequency command = lower bound frequency.
- When PID frequency < min. output frequency and sleep function is enabled (output frequency \( \leq \) sleep frequency and time > detection time), output frequency =0 (in sleep mode). If output frequency \( \leq \) sleep frequency but time < detection time, frequency command = lower frequency. If sleep function is disabled, output frequency =0.
10.17  **PID Offset**

**Factory Setting:** 0.00

**Settings:** 0.00~60.00Hz

- The minimum output frequency in the PID control mode.

10.18  **Feedback of PID physical quantity value**

**Unit:** 0.1

**Settings:** 1.0 to 99.9

**Factory Setting:** 99.9

- When Pr.00.04 is set to 8, it will display 00:00 as follows.
- This parameter is used only for display and has no relation with Pr.00.13, Pr.00.14, Pr.02.18 and Pr.02.19.

10.19  **PID Calculation Mode Selection**

**Factory Setting:** 0

**Settings:**

- 0  Series mode
- 1  Parallel mode

### Series mode

**Diagram:**

10.20  **Treatment of the Erroneous PID Feedback Level**

**Factory Setting:** 0

**Settings:**

- 0  Warning but continue to operate
- 1  Error and coast to stop
- 2  Error and ramp to stop
- 3  Ramp to stop and restart after time set at Pr10.21 (No display of error and warning)
- 4  Ramp to stop, delay the setting time at Pr10.21. The number of time to restart will be limited by the setting of Pr10.50.

- In PID control mode, it will act according to Pr.10.20 when erroneous PID feedback level occurs.
10.21 Restart Delay Time after Erroneous PID Deviation Level
Unit: 1
Settings 1 to 9999 sec
Factory Setting: 60

10.22 Set Point Deviation Level
Unit: 1
Settings 0 to 100%
Factory Setting: 0

10.23 Detection Time of Set Point Deviation Level
Unit: 1
Settings 1 to 9999 sec
Factory Setting: 10

- When the deviation is less than Pr.10.22 (in the range of PID set point to Pr.10.22 X PID set point) for a time exceeding the setting of Pr.10.23, the AC motor drive will decelerate to stop to be constant pressure status (This deceleration time is the setting of Pr.01.12). The system will be ready when the deviation is within the range of PID set point to Pr.10.22 X PID set point during deceleration.
- Example: suppose that the set point of constant pressure control of a pump is 4kg, Pr.10.22 is set to 5%, Pr.10.23 is set to 15 seconds. It means that deviation is 0.2kg (4kgX5%=0.2kg), i.e. when feedback value is higher than 3.8kg for a time exceeding 15 seconds, the AC motor drive will decelerate to stop (this deceleration time will act according to Pr.01.12). When the feedback value is less than 3.8kg, the AC motor drive will start to run.

10.24 Offset Level of Liquid Leakage
Unit: 1
Settings 0 to 50%
Factory Setting: 0

- In the constant pressure status, when the liquid leakage is higher than Pr.10.24 X PID set point, the AC motor drive will start to run.
- It is used to prevent frequent run/stop operation due to liquid leakage.

10.25 Liquid Leakage Change Detection
Unit: 1
Settings 0 to 100% (0:disable)
Factory Setting: 0

10.26 Time Setting for Liquid Leakage Change
Unit: 0.1
Settings 0.1 to 10.0 sec (0:disable)
Factory Setting: 0.5

- When the change of feedback value is less than the settings of Pr.10.25 and Pr.10.26, it means that the liquid is leaking. When the system is in constant pressure status, the AC motor drive will start to run if the feedback value is higher than these two settings.

- Example: suppose that the set point of constant pressure control of a pump is 4kg, Pr.10.22 is set to 5%, Pr.10.23 is set to 15 seconds, Pr.10.24 is set to 25%, Pr.10.25 is set to 3% and Pr.10.26 is set to 0.5 seconds. It means that offset is 0.2kg (4kgX5%=0.2kg), i.e. when feedback value is higher than 3.8kg for a time exceeding 15 seconds, the AC motor drive will decelerate to stop (this deceleration time will act according to Pr.01.12). When the feedback value is less than 3.8kg, the AC motor drive will start to run.

- Status 1: Suppose that the AC motor drive is in the constant pressure status and the feedback change value is less than 0.12kg within 0.5 seconds. The AC motor drive won’t run until the feedback value is decreased by this proportion to the value less than 3kg.

- Status 2: When the AC motor drive is in constant pressure, it won’t run until the feedback change value is less than 3.88kg (4-4kgX3%=3.88kg) for a time exceeding 0.5 seconds.
10.27 | 10.33
Reserved

10.35 Multi-pump control mode
Settings 0~2
0: Disable
1: Fixed time circulation (alternative operation)
2: Fixed quantity control (multi-pump operating at constant pressure.)

Factory Setting: 0

When using multi-pump control mode, the setting of Pr10.35 of each pump has to be the same.

10.36 Multi-pump ID
Settings 0~2
0: Multi-pump control mode is disabled
1: Master
2~4: Slave

Factory Setting: 0

When using multi-pump control mode, the setting of Pr10.36 of each pump has to be the same.

10.37 Multi-pump's fixed time circulation period
Settings 1~ 65535 minutes

Factory Setting: 60

Fixed time circulation mode (alternative operation). For example, when pump 01’s operating time is longer than the setting at Pr10.37, pump 01 will be stopped then pump02 will be activated, so on and so forth.

Fixed quantity control (multi-pump runs at constant pressure). For example, when master pump’s operating time is longer than the setting at Pr10.37, master pump switches to the slave pump.

This parameter only applies on the master pump.

10.38 Frequency to start switching pumps
Settings 0.00Hz~ FMAX

Factory Setting: 60.00

10.39 Time detected when pump reaches the starting frequency
Settings 0.0~ 3600.0 sec

Factory Setting: 1.0

10.40 Frequency to stop switching pumps
Settings 0.00Hz ~ FMAX

Factory Setting: 48.00

10.41 Time detected when pump reaches the stopping frequency
Settings 0.0Hz ~ 3600.0 sec

Factory Setting: 1.0

This parameter only applies on the master pump.

This parameter only works under fixed quantity control (multi-pump operating at constant pressure)

When the master pump’s operating frequency ≥ Pr10.38 and the time elapsed exceeds Pr10.39, a slave pump #1 will be activated. If the quantity of water is still insufficient, slave pump #2 and #3 will be activated under the same conditions.

If the master pump’s operating frequency ≤ Pr10.40 and the time elapsed exceeds Pr01.41, slave pump#1 will be stopped. If the master pump still satisfies those conditions, then the slave pump #2 and #3 will be stopped consecutively. The master pump remains in operation.

It depends on the automatic stop function to determine to stop or not to stop the master pump.

10.42 Pump’s Frequency at Time Out (Disconnection)
Settings 0.00Hz ~ FMAX

Factory Setting: 0.00

This parameter only applies on slave pumps.

Refer to Pr09.02 Transmission Fault Treatment and Pr09.03 Time Out Detection for the conditions to disconnect communication and handling.

If there is a time out occurred under fixed quantity control(multi-pump operating at constant pressure) and a slave pump’s time out frequency = Pr10.42, that slave pump will be in stand-alone mode after stop command is given.

The master pump has the function to redetect if a slave pump is time out.
### 10.43 Pump’s Error Handling

<table>
<thead>
<tr>
<th>Settings</th>
<th>Bit0 ~ Bit2</th>
<th>Factory Setting: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This parameter only applies on the master pump.
- Bit0: If any error occurred during an operation, should the master pump be switched to an alternate pump?
  - 0: Stop all the pumps
  - 1: Switch to an alternate pump
- Bit1: Stop or put the erroneous pump in stand by mode after reset it?
  - 0: Stop the erroneous pump
  - 1: Put the erroneous pump in stand by mode (this pump can receive run command)
- Bit2: Can the master pump accept a run command when there is an erroneous pump?
  - 0: The master pump rejects the run command.
  - 1: The master pump chooses an alternate pump to run.
- For example: When Bit0 = 0, if any error occurred during an operation, all the pumps will be stopped. When Bit0 = 1, if there is any error during an operation, the erroneous pump will be switched to an alternate pump.
- For example: When Bit1 = 1, if there is any error during an operation, the erroneous pump will be switched to a stand by mode.
- For example: When Bit2 = 1, the master pump accepts the run command and choose an alternate pump to run, while drive#2 has an error.
- This parameter only works under auto mode.

### 10.44 Selection of Pump’s Startup Sequence

<table>
<thead>
<tr>
<th>Settings</th>
<th>0~1</th>
<th>Factory Setting: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- 0: By pump ID#
- 1: By running time

### 10.45 Running time of multi-pump under alternative operation

<table>
<thead>
<tr>
<th>Settings</th>
<th>0.0 ~ 360.0 sec</th>
<th>Factory Setting: 60.0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This parameter only applies on the master pump.
- The assigned value (setting value) of time to switch between master pump and slave pump.

### 10.46 Reserved

### 10.47 Reserved

### 10.48 Reserved

### 10.49 Assign the setting of Pr10.12[PID feedback level],

<table>
<thead>
<tr>
<th>Settings</th>
<th>0~1</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- 0: Use the current setting (factory setting), verify if any error by checking feedback deviation.
- 1: Set low water pressure percentage (%), verify if any error by checking physical quantity feedback.

- When the pressure sensor is set to be 10kg, Pr10.49 = 0 and Pr10.12 = 10.0% (that means deviation = 1kg), besides if the target value is 3kg and feedback < 2kg now, the motor drive will follow the setting at Pr10.20.
- When the pressure sensor is set to be 20kg, Pr10.49 = 1 and Pr10.12 = 10.0% (that means the physical quantity = 1kg), besides if the target value = 3kg and feedback < 1kg, the motor drive will follow the setting at Pr10.20.

### 10.50 Number of times to restart when PID error is occurred.

<table>
<thead>
<tr>
<th>Settings</th>
<th>0 ~ 1000 times</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- When Pr10.20 = 4, the number of times to restart when there is a PID error.
**VFD-EL Multi Pumps SOP**

<table>
<thead>
<tr>
<th>STEP</th>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
</table>
| 1    | PID setting | Pressure feedback signal is only connected to the Master, so only the PID of the master pump needs to be setup.  
Pr10.00 (PID Set Point Selection)  
Pr10.01 (Input Terminal for PID Feedback) |
| 2    | KP,KI,KD    | In a multi-pump system, each inverter has a PID controller. All inverters must be setup:  
Pr10.02 (KP)  
Pr10.03(KI)  
Pr10.04(KD) |
| 3    | Acceleration/Deceleration | The acceleration and deceleration time of each inverter has to be setup in a multi-pump system.  
Pr01-09 (Acceleration Time 1)  
Pr01-10 (Deceleration Time 1) |
| 4    | Keypad Display | The keypad of VFD-EL displays PID setting and feedback signal. The following parameters have to be setup in each inverter.  
Pr00.04 (Content of Multi-function Display)  
Set : 5 (Display PID analog feedback signal value in %) or  
8 (Display PID setting and feedback signal.)  
Pr00.13 (User defined Value 1)  
Pr00.14 (Decimal place of user defined Value 1)  
Pr10.18 (Feedback of PID physical quantity value) |
| 5    | Automatic stop function | Each inverter must have a function to detect if it is necessary to stop or not to stop the operation of pumps. The parameters below must be setup:  
Pr10.22 (Set Point Deviation Level)  
Pr10.23 (Detection Time of Set Point Deviation Level)  
Pr01.12 (Deceleration Time 2) |
| 6    | Liquid Leakage | Each inverter must have the restart function after liquid leakage and the related parameters have to be setup.  
**Pr10.24** (Offset Level of Liquid Leakage)  
**Pr10.25** (Liquid Leakage Change Detection)  
**Pr10.26** (Time Setting for Liquid Leakage Change) |
| 7    | Multi-pump function | Distinguish between Master and Slave in accordance of functions required and set up the parameters respectively. |

Note: After setting up the parameters of the Master and Slave. Press the Reset key on the keypad to restart the Master, then the Master will detect the Slave.
Accessories for Multi-Pump under Alternative Operation

Wiring method when the system is under multi-pump operation:
1. Use a RJ45 cable (8 pin, internet cable) without an adaptor. Simply connect master/slave communication port. If there are more than two pumps, use RMKE-HUB01 to connect RJ45

![RJ45 Female connector]

2. Use a RJ11(6pin) cable with an adaptor to connect master/ slave. 4-port communication breakout box

![VFD-CMD04 4-port communication breakout box]

Example:
Set Pr10.35=1: Fixed time circulation (alternative operation of multi-pump at constant pressure)
- There are 4 pumps under alternative operation to increase the system’s life span.
- The water pressure remains at 3kg in a constant pressure water supply system

As shown by Image below:

### Chapter 4 Parameters

#### 01.00 Maximum Output Frequency (Fmax)
- Setting: 50.00 to 600.0 Hz
- Factory Setting: 60.00
- User’s Setting: 60.00
- Note: The setting follows the specifications of pumps.

#### 01.01 Maximum Voltage Frequency (Fbase)
- Setting: 0.10 to 600.0 Hz
- Factory Setting: 60.00
- Note: The setting follows the specifications of pumps.

#### 01.02 Maximum Output Voltage (Vmax)
- Setting: 115V/230V series: 0.1V to 255.0V
  - Factory Setting: 220.0
- 460V series: 0.1V to 510.0V
  - Factory Setting: 440.0

#### 01.09 Accel Time 1
- Setting: 0.1 to 600.0 / 0.01 to 600.0 sec
- Factory Setting: 10.0
- Note: Defined by users.

#### 01.10 Decel Time 1
- Setting: 0.1 to 600.0 / 0.01 to 600.0 sec
- Factory Setting: 10.0
- Note: Defined by users.

#### 01.12 Decel Time 2
- Setting: 0.1 to 600.0 / 0.01 to 600.0 sec
- Factory Setting: 10.0
- Note: Defined by users.

### 02.00 Source of First Master Frequency Command
- Setting: 0: Digital keypad UP/DOWN keys or Multi-function Inputs UP/DOWN. Last used frequency saved.
  - 1: 0 to +10V from AVI
  - 2: 4 to 20mA from ACI
  - 3: RS-485 (RJ-45) communication
  - 4: Digital keypad potentiometer
- Factory Setting: 0
- Note: Defined by users.

### 02.01 Source of First Operation Command
- Setting: 0: Digital keypad
- Factory Setting: 0
- Note: Defined by users.

Chapter 5 Troubleshooting

5.1 Over Current (OC)

- **OCa** Over-current during acceleration
- **ocd** Over-current during deceleration
- **OC** Over current

**Remove short circuit or ground fault**

- Yes
  - Check if there is any short circuits and grounding between the U, V, W and motor
  - Yes
    - Remove short circuit or ground fault
  - No
    - Reduce the load or increase the power of AC motor drive
      - Yes
        - Reduce torque compensation
        - No
          - Check if load is too large
  - No
    - Reduce torque compensation

**Check if load is too large**

- Yes
  - Maybe AC motor drive has malfunction or error due to noise. Please contact with DELTA.
  - Yes
    - Can acceleration time be made longer?
      - Yes
        - Increase accel/decel time
      - No
        - Reduce load or increase the power of AC motor drive
  - No
    - Has load changed suddenly?
      - Yes
        - Reduce load or increase the power of AC motor drive
      - No
        - Can deceleration time be made longer?
          - Yes
            - Check braking method. Please contact DELTA
          - No
            - Check if deceleration time is too short by load inertia.
5.2 Ground Fault

- GFF: Ground fault
- Is output circuit (cable or motor) of AC motor drive grounded?
  - Yes: Remove ground fault
  - No: Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.

5.3 Over Voltage (OV)

- Over voltage
  - Is voltage within specification
    - Yes
      - Has over-voltage occurred without load?
        - Yes: Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.
        - No
          - When OV occurs, check if the voltage of DC BUS is greater than protection value?
            - Yes: Increase deceleration time
              - No: Increase acceleration time
            - No: Increase setting time
              - No: Reduce moment of inertia
                - No: Reduce moment of load inertia
                  - No: Use braking unit or DC braking
                    - Yes: Need to consider using braking unit or DC braking
                      - No: Need to check control method. Please contact DELTA.
5.4 Low Voltage (Lv)

Is input power correct? Or power cut, including momentary power loss

- Yes → Restart after reset
- No → Check if there is any malfunction component or disconnection in power supply circuit

- Yes → Change defective component and check connection
- No → Check if voltage is within specification

- Yes → Check if there is heavy load with high start current in the same power system
- No → Make necessary corrections, such as change power supply system for requirement

- Yes → Suitable power transformer capacity
- No → Check if voltage between +/B1 and - is greater than 200VDC (for 115V/230V models) or 400VDC (for 460V models)

- Yes → Maybe AC motor drive has malfunction. Please contact DELTA.
- No → Control circuit has malfunction or misoperation due to noise. Please contact DELTA.
5.5 Over Heat (OH1)

- AC motor drive overheats
  - Heat sink overheats
    - Check if temperature of heat sink is greater than 90°C
      - Yes: Is load too large
        - Yes: Reduce load
        - No: Temperature detection malfunctions. Please contact DELTA.
      - No: No
  - If cooling fan functions normally
    - No: Change cooling fan
    - Yes: Check if surrounding temperature is within specification
      - Yes: Remove obstruction
      - No: Adjust surrounding temperature to specification

5.6 Overload

- OL
- OL1/OL2
  - Check for correct settings at Pr. 06-06 and 06-07
    - No: Modify setting
    - Yes: Is load too large
      - No: Maybe AC motor drive has malfunction or misoperation due to noise.
      - Yes: Reduce load or increase the power of AC motor drive
5.7 Keypad Display is Abnormal

Abnormal display or no display

Yes

Cycle power to AC motor drive

Yes

Fix connector and eliminate noise

No

Check if all connectors are connect correctly and no noise is present

No

Display normal?

Yes

AC motor drive works normally

Yes

AC motor drive has malfunction. Please contact DELTA.

5.8 Phase Loss (PHL)

Phase loss

Check wiring at R, S and T terminals

No

Correct wiring

Yes

Check if the screws of terminals are tightened

No

Tighten all screws

Yes

Check if the input voltage of R, S, T is unbalanced

No

Please check the wiring and power system for abnormal power

Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.
5.9 Motor cannot Run

Motor cannot run

Check keypad for normal display

No

Check if non-fuse breaker and magnetic contactor are ON

No

Set them to ON

Yes

Reset after clearing fault and then RUN

Check if there is any fault code displayed

No

Check if input voltage is normal

No

Check if any faults occur, such as Lv, PHL or disconnection

Yes

No

Input "RUN" command by keypad

Yes

Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.

No

Press RUN key to check if it can run

Press UP key to set frequency

Yes

Press UP to check if motor can run

No

Modify frequency setting

Yes

Set frequency or not

No

Check if input FWD or REV command

Yes

Check if the wiring of terminal M1 and between M2-DCM is correct

Yes

Change switch or relay

No

Check if the parameter setting and wiring of analog signal and multi-step speed are correct

Yes

Change defective potentiometer and relay

No

Check if there is any output voltage from terminals U, V and W

Yes

Check if motor connection is correct

Yes

Motor has malfunction

No

Check if the setting of torque compensation is correct

Yes

Motor is locked due to large load, please reduce load. For example, if there is a brake, check if it is released.

No

Increase the setting of torque compensation

No

Maybe AC motor drive has malfunction. Please contact DELTA.

Yes

Connect correctly
5.10 Motor Speed cannot be Changed

Motor can run but cannot change speed

Modify the setting

Yes

Check if the setting of the max. frequency is too low

No

If the setting of frequency is out of range (upper/lower) bound

Yes

Modify the setting

No

No

Check if the setting of Pr.05-00 to Pr.05-14 are the same

Yes

Modify the setting

No

Press UP/DOWN key to see if speed has any change

Yes

If there is any change of the signal that sets frequency (0-10V and 4-20mA)

No

No

Check if the wiring between M1-M6 to DCM is correct

Yes

Connect correctly

No

Check if the wiring of external terminal is correct

Yes

Check if frequency for each step is different

No

Change defective potentiometer

Yes

Change frequency setting

No

If accel./decel. time is very long

Yes

Please set suitable accel./decel. time by load inertia

No

Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.
5.11 Motor Stalls during Acceleration

Motor stalls during acceleration → Check if acceleration time is too short

- Yes, Increase setting time
- No

Check if the inertia of the motor and load is too high

- Yes, Use special motor?
- No

Thicken or shorten the wiring between the motor or AC motor drive

- Yes
- No

Reduce load or increase the capacity of AC motor drive

- Yes
- No

Check for low voltage at input

- Yes
- No

Check if the load torque is too high

- Yes
- No

Check if the torque compensation is suitable

- Yes, Increase torque compensation
- No

Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.

---

5.12 The Motor does not Run as Expected

Motor does not run as expected → Check Pr. 01-01 thru Pr. 01-06 and torque compensation settings

- No
- Yes

Adjust Pr. 01-01 to Pr. 01-06 and lower torque compensation

Run in low speed continuously

- Yes, Please use specific motor
- No

Is load too large

- Yes, Reduce load or increase the capacity of AC motor drive
- No

Check if output voltage of U, V, W is balanced

- Yes, Motor has malfunction
- No

Maybe AC motor drive has malfunction or misoperation due to noise. Please contact DELTA.
5.13 Electromagnetic/Induction Noise
Many sources of noise surround AC motor drives and penetrate it by radiation or conduction. It may cause malfunctioning of the control circuits and even damage the AC motor drive. Of course, there are solutions to increase the noise tolerance of an AC motor drive. But this has its limits. Therefore, solving it from the outside as follows will be the best.

1. Add surge suppressor on the relays and contacts to suppress switching surges.
2. Shorten the wiring length of the control circuit or serial communication and keep them separated from the power circuit wiring.
3. Comply with the wiring regulations by using shielded wires and isolation amplifiers for long length.
4. The grounding terminal should comply with the local regulations and be grounded independently, i.e. not to have common ground with electric welding machines and other power equipment.
5. Connect a noise filter at the mains input terminal of the AC motor drive to filter noise from the power circuit. VFD-EL can have a built-in filter as option.

In short, solutions for electromagnetic noise exist of “no product” (disconnect disturbing equipment), “no spread” (limit emission for disturbing equipment) and “no receive” (enhance immunity).

5.14 Environmental Condition
Since the AC motor drive is an electronic device, you should comply with the environmental conditions. Here are some remedial measures if necessary.

1. To prevent vibration, the use of anti-vibration dampers is the last choice. Vibrations must be within the specification. Vibration causes mechanical stress and it should not occur frequently, continuously or repeatedly to prevent damage to the AC motor drive.
2. Store the AC motor drive in a clean and dry location, free from corrosive fumes/dust to prevent corrosion and poor contacts. Poor insulation in a humid location can cause short-circuits. If necessary, install the AC motor drive in a dust-proof and painted enclosure and in particular situations, use a completely sealed enclosure.
3. The ambient temperature should be within the specification. Too high or too low temperature will affect the lifetime and reliability. For semiconductor components, damage will occur once any specification is out of range. Therefore, it is necessary to periodically check air quality and the cooling fan and provide extra cooling of necessary. In addition, the microcomputer may not work in extremely low temperatures, making cabinet heating necessary.
4. Store within a relative humidity range of 0% to 90% and non-condensing environment. Use an air conditioner and/or exsiccator.

5.15 Affecting Other Machines
An AC motor drive may affect the operation of other machines due to many reasons. Some solutions are:

- High Harmonics at Power Side
  High harmonics at power side during running can be improved by:
  1. Separate the power system: use a transformer for AC motor drive.
  2. Use a reactor at the power input terminal of the AC motor drive.
  3. If phase lead capacitors are used (never on the AC motor drive output!!), use serial reactors to prevent damage to the capacitors damage from high harmonics.

- Motor Temperature Rises
  When the motor is a standard induction motor with fan, the cooling will be bad at low speeds, causing the motor to overheat. Besides, high harmonics at the output increases copper and core losses. The following measures should be used depending on load and operation range.
  1. Use a motor with independent ventilation (forced external cooling) or increase the motor rated power.
  2. Use a special inverter duty motor.
  3. Do NOT run at low speeds for long time.
## Chapter 6 Fault Code Information and Maintenance

### 6.1 Fault Code Information

The AC motor drive has a comprehensive fault diagnostic system that includes several different alarms and fault messages. Once a fault is detected, the corresponding protective functions will be activated. The following faults are displayed as shown on the AC motor drive digital keypad display. The five most recent faults can be read from the digital keypad or communication.

**NOTE**
Wait 5 seconds after a fault has been cleared before performing reset via keypad of input terminal.

### 6.1.1 Common Problems and Solutions

<table>
<thead>
<tr>
<th>Fault Name</th>
<th>Fault Descriptions</th>
<th>Corrective Actions</th>
</tr>
</thead>
</table>
| Over current | Abnormal increase in current. | 1. Check if motor power corresponds with the AC motor drive output power.  
2. Check the wiring connections to U/T1, V/T2, W/T3 for possible short circuits.  
3. Check the wiring connections between the AC motor drive and motor for possible short circuits, also to ground.  
4. Check for loose contacts between AC motor drive and motor.  
5. Increase the Acceleration Time.  
6. Check for possible excessive loading conditions at the motor.  
7. If there are still any abnormal conditions when operating the AC motor drive after a short-circuit is removed and the other points above are checked, it should be sent back to manufacturer. |
| Over voltage | The DC bus voltage has exceeded its maximum allowable value. | 1. Check if the input voltage falls within the rated AC motor drive input voltage range.  
2. Check for possible voltage transients.  
3. DC-bus over-voltage may also be caused by motor regeneration. Either increase the Decel. Time or add an optional brake resistor (and brake unit).  
4. Check whether the required brake power is within the specified limits. |
| Overheating | Heat sink temperature too high | 1. Ensure that the ambient temperature falls within the specified temperature range.  
2. Make sure that the ventilation holes are not obstructed.  
3. Remove any foreign objects from the heatsinks and check for possible dirty heat sink fins.  
4. Check the fan and clean it.  
5. Provide enough spacing for adequate ventilation. (See chapter 1) |
| Low voltage | The AC motor drive detects that the DC bus voltage has fallen below its minimum value. | 1. Check whether the input voltage falls within the AC motor drive rated input voltage range.  
2. Check for abnormal load in motor.  
3. Check for correct wiring of input power to R-S-T (for 3-phase models) without phase loss. |
| Overload | The AC motor drive detects excessive drive output current. **NOTE:** The AC motor drive can withstand up to 150% of the rated current for a maximum of 60 seconds. | 1. Check whether the motor is overloaded.  
2. Reduce torque compensation setting in Pr.07.02.  
3. Use the next higher power AC motor drive model. |
<table>
<thead>
<tr>
<th>Fault Name</th>
<th>Fault Descriptions</th>
<th>Corrective Actions</th>
</tr>
</thead>
</table>
| **Overload 1** | Internal electronic overload trip | 1. Check for possible motor overload.  
2. Check electronic thermal overload setting.  
3. Use a higher power motor.  
4. Reduce the current level so that the drive output current does not exceed the value set by the Motor Rated Current Pr.07.00. |
| **Overload 2** | Motor overload. | 1. Reduce the motor load.  
2. Adjust the over-torque detection setting to an appropriate setting (Pr.06.03 to Pr.06.05). |
| **KPF 1** | CC (current clamp) | Return to the factory. |
| **KPF 2** | OV hardware error | Return to the factory. |
| **KPF 3** | GFF hardware error | |
| **KPF 4** | OC hardware error | |
| **External Base Block.** | External Base Block. (Refer to Pr. 08.07) | 1. Short-circuit at motor output: Check for possible poor insulation at the output lines.  
2. Torque boost too high: Decrease the torque compensation setting in Pr.07.02.  
4. AC motor drive output power is too small: Replace the AC motor drive with the next higher power model. |
| **Over-current during acceleration** | Over-current during acceleration | 1. Short-circuit at motor output: Check for possible poor insulation at the output line.  
3. AC motor drive output power is too small: Replace the AC motor drive with the next higher power model. |
| **Over-current during deceleration** | Over-current during deceleration | 1. Short-circuit at motor output: Check for possible poor insulation at the output line.  
2. Sudden increase in motor loading: Check for possible motor stall.  
3. AC motor drive output power is too small: Replace the AC motor drive with the next higher power model. |
| **Over-current during constant speed operation** | Over-current during constant speed operation | 1. When multi-function input terminals (MI3-MI9) are set to external fault, the AC motor drive stops output U, V and W.  
2. Give RESET command after fault has been cleared. |
| **EF** | External Fault | |

6.1.2 Reset
There are three methods to reset the AC motor drive after solving the fault:

1. Press key on keypad.
2. Set external terminal to “RESET” (set one of Pr.04.05~Pr.04.08 to 05) and then set to be ON.
3. Send “RESET” command by communication.

NOTE
Make sure that RUN command or signal is OFF before executing RESET to prevent damage or personal injury due to immediate operation.

6.2 Maintenance and Inspections
Modern AC motor drives are based on solid-state electronics technology. Preventive maintenance is required to keep the AC motor drive in its optimal condition, and to ensure a long life. It is recommended to have a qualified technician perform a check-up of the AC motor drive regularly.

Daily Inspection:
Basic check-up items to detect if there were any abnormalities during operation are:

1. Whether the motors are operating as expected.
2. Whether the installation environment is abnormal.
3. Whether the cooling system is operating as expected.
4. Whether any irregular vibration or sound occurred during operation.
5. Whether the motors are overheating during operation.
6. Always check the input voltage of the AC drive with a Voltmeter.

Periodic Inspection:
Before the check-up, always turn off the AC input power and remove the cover. Wait at least 10 minutes after all display lamps have gone out, and then confirm that the capacitors have fully discharged by measuring the voltage between \( \oplus \sim \ominus \). It should be less than 25VDC.
DANGER!

1. Disconnect AC power before processing!
2. Only qualified personnel can install, wire and maintain AC motor drives. Please take off any metal objects, such as watches and rings, before operation. And only insulated tools are allowed.
3. Never reassemble internal components or wiring.
4. Prevent static electricity.

### Periodical Maintenance

#### Ambient environment

### B.1 All Brake Resistors & Brake Units Used in AC Motor Drives

Note: Please only use DELTA resistors and recommended values. Other resistors and values will void Delta’s warranty. Please contact your nearest Delta representative for use of special resistors. The brake unit should be at least 10 cm away from AC motor drive to avoid possible interference. Refer to the “Brake unit Module User Manual” for further details.

| 5       | 3.7              | VFD037EL43A     | 2.080                      | 600W 140Ω                             | BUE-40037                              | BR300W070                                   | 2*                | 150                                                 | 84.4Ω                |

*Connect these two brake resistors in series.
1. If damage to the drive or other equipment is due to the fact that the brake resistors and the brake modules in use are not provided by Delta, the warranty will be void.

2. Take into consideration the safety of the environment when installing the brake resistors.

3. If the minimum resistance value is to be utilized, consult local dealers for the calculation of the power in Watt.

4. Please select thermal relay trip contact to prevent resistor over load. Use the contact to switch power off to the AC motor drive!

5. When using more than 2 brake units, equivalent resistor value of parallel brake unit can’t be less than the value in the column “Minimum Equivalent Resistor Value for Each AC Drive” (the right-most column in the table).

6. Please read the wiring information in the user manual of the brake unit thoroughly prior to installation and operation.

7. Definition for Brake Usage ED%
   Explanation: The definition of the brake usage ED(%) is for assurance of enough time for the brake unit and brake resistor to dissipate away heat generated by braking. When the brake resistor heats up, the resistance would increase with temperature, and brake torque would decrease accordingly. Suggested cycle time is one minute

\[
ED\% = \frac{T1}{T0} \times 100(\%)
\]

8. For safety reasons, install a thermal overload relay between brake unit and brake resistor. Together with the magnetic contactor (MC) in the mains supply circuit to the drive it offers protection in case of any malfunctioning. The purpose of installing the thermal overload relay is to protect the brake resistor against damage due to frequent brake or in case the brake unit is continuously on due to unusual high input voltage. Under these circumstances the thermal overload relay switches off the power to the drive. Never let the thermal overload relay switch off only the brake resistor as this will cause serious damage to the AC Motor Drive.

Note1: When using the AC drive with DC reactor, please refer to wiring diagram in the AC drive user manual for the wiring of terminal +P of Brake unit.

Note2: Do NOT wire terminal -(N) to the neutral point of power system.

<table>
<thead>
<tr>
<th>Application 2</th>
<th>Question</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silicon rectifier and AC motor drive are connected to the same power.</td>
<td>Switching spikes will be generated when the silicon rectifier switches on/off. These spikes may damage the mains circuit.</td>
</tr>
</tbody>
</table>

**Correct wiring**

![Correct wiring diagram](image)

<table>
<thead>
<tr>
<th>Application 3</th>
<th>Question</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used to improve the input power factor, to reduce harmonics and provide protection from AC line disturbances (surges, switching spikes, short interruptions, etc.). The AC line reactor should be installed when the power supply capacity is 500kVA or more and exceeds 6 times the inverter capacity, or the mains wiring distance ( \leq 10 \text{ m} ).</td>
<td>When the mains power capacity is too large, line impedance will be small and the charge current will be too high. This may damage AC motor drive due to higher rectifier temperature.</td>
</tr>
</tbody>
</table>

**Correct wiring**

</tbody>
</table>

**Note:** 600V Insulated unshielded Cable.

---

**Diagram A**

Please wind each wire 4 times around the core. The reactor must be put at inverter output as close as possible.

---

**Diagram B**

Please put all wires through 4 cores in series without

---

Revision May 2014 4ELE, V1.12
**Note 1:** The table above gives approximate wire size for the zero phase reactors but the selection is ultimately governed by the type and diameter of cable fitted i.e. the cable must fit through the center hole of zero phase reactors.

**Note 2:** Only the phase conductors should pass through, not the earth core or screen.

**Note 3:** When long motor output cables are used an output zero phase reactor may be required to reduce radiated emissions from the cable.

**B.6 Remote Controller RC-01**
Dimensions are in millimeter

B.7 PU06

B.7.1 Description of the Digital Keypad VFD-PU06

**LED Display**
Indicates frequency, voltage, current, user defined units, read, and save, etc.

**Model Number**

**Status Display**
Display the driver's current status.

**MODE**
Change between different display modes.

**PU Key**
Switch the operation command source.

**Right Key**
Move the cursor to the right.

**PROG/DATA**
Used to enter programming parameters.

**STOP/RESET**
Stops AC drive operation and reset the drive after fault occurred.

**RUN Key**
Start AC drive operation.

**JOG**
By pressing JOG key, Jog frequency operation.

**UP and DOWN Key**
Set the parameter number and changes the numerical data, such as Master Frequency.

**Left Key**
Move cursor to the left.

**FWD/REV Key**
Select FWD/REV operation.

**Frequency Command**
Status indicator

**Output Frequency**
Status indicator

**User Defined Units**

<td></td>
</tr>
</tbody>
</table>
B.8.1.3 Power Supply
No external power is needed. Power is supplied via RS-485 port that is connected to VFD-EL. An 8 pins RJ-45 cable, which is packed together with this communication module, is used to connect the RS-485 port between VFD-EL and this communication module for power. This communication module will perform the function once it is connected. Refer to the following paragraph for LED indications.

B.8.1.4 LEDs Display
1. SP: Green LED means in normal condition, Red LED means abnormal condition.
2. Module: Green blinking LED means no I/O data transmission, Green steady LED means I/O data transmission OK.
   Red LED blinking or steady LED means module communication is abnormal.
3. Network: Green LED means DeviceNet communication is normal, Red LED means abnormal

B.8.2 LonWorks Communication Module (CME-LW01)

B.8.2.1 Introduction
Device CME-LW01 is used for communication interface between Modbus and LonTalk. CME-LW01 needs be configured via LonWorks network tool first, so that it can perform the function on LonWorks network. No need to set CME-LW01 address.
This manual provides instructions for the installation and setup for CME-LW01 that is used to communicate with Delta VFD-EL (firmware version of VFD-EL should conform with CME-LW01 according to the table below) via LonWorks Network.

B.8.2.2 Dimensions

UNIT : mm(inch)
B.8.2.3 Specifications

Power supply: 16-30VDC, 750mW
Communication: Modbus in ASCII format, protocol: 9600, 7, N, 2
LonTalk: free topology with FTT-10A 78 Kbps,
LonTalk terminal: 4-pin terminals, wire gauge: 28-12 AWG, wire strip length: 7-8mm
RS-485 port: 8 pins with RJ-45

B.8.2.4 Wiring

B.8.2.5 LED Indications

There are three LEDs in front panel of CME-LW01. If the communication is normal, power LED, SP LED should be green (red LED means abnormal communication) and service LED should be OFF. If LEDs display do not match, refer to user manual for details.
B.8.3 Profibus Communication Module (CME-PD01)

B.8.3.1 Panel Appearance

1. SP LED: Indicating the connection status between VFD-EL and CME-PD01.
2. NET LED: Indicating the connection status between CME-PD01 and PROFIBUS-DP.
3. Address Switches: Setting the address of CME-PD01 on PROFIBUS-DP network.
4. RS-485 Interface (RJ45): Connecting to VFD-EL, and supply power to CME-PD01.
5. PROFIBUS-DP Interface (DB9): 9-PIN connector that connects to PROFIBUS-DP network.
6. Extended Socket: 4-PIN socket that connects to PROFIBUS-DP network.
B.8.3.2 Dimensions

UNIT: mm (inch)

B.8.3.4 Power Supply

The power of CME-PD01 is supplied from VFD-EL. Please connect VFD-EL to CME-PD01 by using 8 pins RJ-45 cable, which is packed together with CME-PD01. After connection is completed, CME-PD01 is powered whenever power is applied to VFD-EL.

B.8.3.5 PROFIBUS Address

CME-PD01 has two rotary switches for the user to select the PROFIBUS address. The set value via 2 address switches, ADDH and ADDL, is in HEX format. ADDH sets the upper 4 bits, and ADDL sets the lower 4 bits of the PROFIBUS address.

<table>

### B.9 MKE-EP & DIN Rail

#### B.9.1 MKE-EP

EMC earthing plate for Shielding Cable

![Diagram of MKE-EP & DIN Rail Components]
B.9.2 DIN Rail: MKEL-DRA (Only for frame A)

Dimensions

This DIN rail (MKEL-DRA) is only for frame A. For frame B, it is shipped with DIN rail (MKEL-DRB). Refer to chapter 1.3 for VFD-EL dimension.

**NOTE**

Frame A: VFD002EL11A/21A/23A, VFD004EL11A/21A/23A/43A, VFD007EL21A/23A/43A, VFD015EL23A/43A

Frame B: VFD007EL11A, VFD015EL21A, VFD022EL21A/23A/43A, VFD037EL23A/43A
The choice of the right AC motor drive for the application is very important and has great influence on its lifetime. If the capacity of AC motor drive is too large, it cannot offer complete protection to the motor and motor maybe damaged. If the capacity of AC motor drive is too small, it cannot offer the required performance and the AC motor drive maybe damaged due to overloading.

But by simply selecting the AC motor drive of the same capacity as the motor, user application requirements cannot be met completely. Therefore, a designer should consider all the conditions, including load type, load speed, load characteristic, operation method, rated output, rated speed, power and the change of load capacity. The following table lists the factors you need to consider, depending on your requirements.

<table>
<thead>
<tr>

</tbody>
</table>
Appendix C How to Select the Right AC Motor Drive

C.1 Capacity Formulas

1. When one AC motor drive operates one motor
   The starting capacity should be less than 1.5x rated capacity of AC motor drive
   The starting capacity=
   \[
   \frac{k \times N}{973 \times \eta \times \cos \phi} \left( T_s + \frac{GD^2}{375} \times \frac{N}{T_s} \right) \leq 1.5 \times \text{the \ capacity \ of \ AC \ motor \ drive}(kVA)
   \]

2. When one AC motor drive operates more than one motor
   2.1 The starting capacity should be less than the rated capacity of AC motor drive
      - **Acceleration time** \( \leq 60 \) seconds
      \[
      \frac{k \times N}{\eta \times \cos \phi} [n + n.(k_s - 1)] = PC \left[ 1 + \frac{n.}{n_r} (k_r - 1) \right] \leq 1.5 \times \text{the \ capacity \ of \ AC \ motor \ drive}(kVA)
      \]
      - **Acceleration time** \( \geq 60 \) seconds
      The starting capacity=
      \[
      \frac{k \times N}{\eta \times \cos \phi} [n + n.(k_s - 1)] = PC \left[ 1 + \frac{n.}{n_r} (k_r - 1) \right] \leq \text{the \ capacity \ of \ AC \ motor \ drive}(kVA)
      \]

2.2 The current should be less than the rated current of AC motor drive(A)
      - **Acceleration time** \( \leq 60 \) seconds
      \[
      n. + I_u \left[ 1 + \frac{n.}{n_r} (k_s - 1) \right] \leq 1.5 \times \text{the \ rated \ current \ of \ AC \ motor \ drive}(A)
      \]
      - **Acceleration time** \( \geq 60 \) seconds
      \[
      n. + I_u \left[ 1 + \frac{n.}{n_r} (k_s - 1) \right] \leq \text{the \ rated \ current \ of \ AC \ motor \ drive}(A)
      \]
2.3 When it is running continuously

- The requirement of load capacity should be less than the capacity of AC motor drive (kVA)
  \[
  \frac{k \times P_m}{\eta \times \cos \phi} \leq \text{the capacity of AC motor drive (kVA)}
  \]

- The motor capacity should be less than the capacity of AC motor drive
  \[
  k \times \sqrt{3} \times V_N \times I_u \times 10^{-3} \leq \text{the capacity of AC motor drive (kVA)}
  \]

- The current should be less than the rated current of AC motor drive (A)
  \[
  k \times I_u \leq \text{the rated current of AC motor drive (A)}
  \]

**Symbol explanation**

- \( P_m \): Motor shaft output for load (kW)
- \( \eta \): Motor efficiency (normally, approx. 0.85)
- \( \cos \phi \): Motor power factor (normally, approx. 0.75)
- \( V_N \): Motor rated voltage (V)
- \( I_u \): Motor rated current (A), for commercial power
- \( k \): Correction factor calculated from current distortion factor (1.05-1.1, depending on PWM method)
- \( P_{C1} \): Continuous motor capacity (kVA)
- \( k_s \): Starting current/rated current of motor
- \( n_r \): Number of motors in parallel
- \( n_s \): Number of simultaneously started motors
- \( G D^2 \): Total inertia (GD²) calculated back to motor shaft (kg m²)
- \( T_L \): Load torque
- \( t_a \): Motor acceleration time
- \( N \): Motor speed

**C.2 General Precaution**

**Selection Note**

1. When the AC Motor Drive is connected directly to a large-capacity power transformer (600kVA or above) or when a phase lead capacitor is switched, excess peak currents may occur in the power input circuit and the converter section may be damaged. To avoid this, use an AC input reactor (optional) before AC Motor Drive mains input to reduce the current and improve the input power efficiency.

2. When a special motor is used or more than one motor is driven in parallel with a single AC Motor Drive, select the AC Motor Drive current \( \geq 1.25 \times \text{Sum of the motor rated currents} \).

3. The starting and accel./decel. characteristics of a motor are limited by the rated current and the overload protection of the AC Motor Drive. Compared to running the motor D.O.L. (Direct On-Line), a lower starting torque output with AC Motor Drive can be expected. If higher starting torque is required (such as for elevators, mixers, tooling machines, etc.) use an AC Motor Drive of higher capacity or increase the capacities for both the motor and the AC Motor Drive.

4. When an error occurs on the drive, a protective circuit will be activated and the AC Motor Drive output is turned off. Then the motor will coast to stop. For an emergency stop, an external mechanical brake is needed to quickly stop the motor.

**Parameter Settings Note**

1. The AC Motor Drive can be driven at an output frequency up to 400Hz (less for some models) with the digital keypad. Setting errors may create a dangerous situation. For safety, the use of the upper limit frequency function is strongly recommended.

2. High DC brake operating voltages and long operation time (at low frequencies) may cause overheating of the motor. In that case, forced external motor cooling is recommended.

3. Motor accel./decel. time is determined by motor rated torque, load torque, and load inertia.
Appendix C How to Select the Right AC Motor Drive

4. If the stall prevention function is activated, the accel./decel. time is automatically extended to a length that the AC Motor Drive can handle. If the motor needs to decelerate within a certain time with high load inertia that can’t be handled by the AC Motor Drive in the required time, either use an external brake resistor and/or brake unit, depending on the model, (to shorten deceleration time only) or increase the capacity for both the motor and the AC Motor Drive.

C.3 How to Choose a Suitable Motor

Standard motor
When using the AC Motor Drive to operate a standard 3-phase induction motor, take the following precautions:

1. The energy loss is greater than for an inverter duty motor.
2. Avoid running motor at low speed for a long time. Under this condition, the motor temperature may rise above the motor rating due to limited airflow produced by the motor’s fan. Consider external forced motor cooling.
3. When the standard motor operates at low speed for long time, the output load must be decreased.
4. The load tolerance of a standard motor is as follows:

<table>
<thead>
<tr>
<th>Load duty-cycle</th>
<th>25%</th>
<th>40%</th>
<th>60%</th>
</tr>
</thead>
<tbody>
<tr>
<td>torque (%)</td>
<td>82</td>
<td>60</td>
<td>50</td>
</tr>
</tbody>
</table>

5. If 100% continuous torque is required at low speed, it may be necessary to use a special inverter duty motor.
6. Motor dynamic balance and rotor endurance should be considered once the operating speed exceeds the rated speed (60Hz) of a standard motor.
7. Motor torque characteristics vary when an AC Motor Drive instead of commercial power supply drives the motor. Check the load torque characteristics of the machine to be connected.
8. Because of the high carrier frequency PWM control of the VFD series, pay attention to the following motor vibration problems:
   - Resonant mechanical vibration: anti-vibration (damping) rubbers should be used to mount equipment that runs at varying speed.
   - Motor imbalance: special care is required for operation at 50 or 60 Hz and higher frequency.
   - To avoid resonances, use the Skip frequencies.
9. The motor fan will be very noisy when the motor speed exceeds 50 or 60Hz.

Special motors:
1. Pole-changing (Dahlander) motor:
   The rated current is differs from that of a standard motor. Please check before operation and select the capacity of the AC motor drive carefully. When changing the pole number the motor needs to be stopped first. If over current occurs during operation or regenerative voltage is too high, please let the motor free run to stop (coast).
2. Submersible motor:
   The rated current is higher than that of a standard motor. Please check before operation and choose the capacity of the AC motor drive carefully. With long motor cable between AC motor drive and motor, available motor torque is reduced.
3. Explosion-proof (Ex) motor:
   Needs to be installed in a safe place and the wiring should comply with the (Ex) requirements. Delta AC Motor Drives are not suitable for (Ex) areas with special precautions.

4. Gear reduction motor:
   The lubricating method of reduction gearbox and speed range for continuous operation will be different and depending on brand. The lubricating function for operating long time at low speed and for high-speed operation needs to be considered carefully.

5. Synchronous motor:
   The rated current and starting current are higher than for standard motors. Please check before operation and choose the capacity of the AC motor drive carefully. When the AC motor drive operates more than one motor, please pay attention to starting and changing the motor.

Power Transmission Mechanism
Pay attention to reduced lubrication when operating gear reduction motors, gearboxes, belts and chains, etc. over longer periods at low speeds. At high speeds of 50/60Hz and above, lifetime reducing noises and vibrations may occur.

Motor torque
The torque characteristics of a motor operated by an AC motor drive and commercial mains power are different.
Below you’ll find the torque-speed characteristics of a standard motor (4-pole, 15kW):
